       1.9.1. Percentile over timesteps
   2. Reference manual
      2.1. Information
         2.1.1. INFO - Information and simple statistics
         2.1.2. SINFO - Short information
         2.1.3. DIFF - Compare two datasets field by field
         2.1.4. NINFO - Print the number of parameters, levels or times
         2.1.5. SHOWINFO - Show variables, levels or times
         2.1.6. SHOWATTRIBUTE - Show attributes
         2.1.7. FILEDES - Dataset description
      2.2. File operations
         2.2.1. APPLY - Apply operators
         2.2.2. COPY - Copy datasets
         2.2.3. TEE - Duplicate a data stream and write it to file
         2.2.4. PACK - Pack data
         2.2.5. REPLACE - Replace variables
         2.2.6. DUPLICATE - Duplicates a dataset
         2.2.7. MERGEGRID - Merge grid
         2.2.8. MERGE - Merge datasets
         2.2.9. SPLIT - Split a dataset
2.8. Statistical values .................................................. 95
2.8.1. TIMCUMSUM - Cumulative sum over all timesteps .......... 102
2.8.2. CONSECSTAT - Consecutive timestep periods ............... 102
2.8.3. VARSSTAT - Statistical values over all variables .......... 103
2.8.4. ENSSTAT - Statistical values over an ensemble ............. 104
2.8.5. ENSSTAT2 - Statistical values over an ensemble .......... 105
2.8.6. ENSVAL - Ensemble validation tools .......................... 107
2.8.7. FLDSTAT - Statistical values over a field .................. 109
2.8.8. ZONSTAT - Zonal statistical values .......................... 111
2.8.9. MERSTAT - Meridional statistical values ............................................. 112
2.8.10. GRIDBOXSTAT - Statistical values over grid boxes ......................... 114
2.8.11. VERTSTAT - Vertical statistical values ........................................... 115
2.8.12. TIMSELAST - Time range statistical values ...................................... 116
2.8.13. TIMSELPCTL - Time range percentile values .................................... 117
2.8.14. RUNSTAT - Running statistical values ............................................. 118
2.8.15. RUNPCTL - Running percentile values ............................................ 119
2.8.16. TIMSTAT - Statistical values over all timesteps ............................... 120
2.8.17. TIMPCTL - Percentile values over all timesteps ............................... 121
2.8.18. HOURSTAT - Hourly statistical values ............................................ 122
2.8.19. HOURPCTL - Hourly percentile values ............................................ 123
2.8.20. DAYSTAT - Daily statistical values ............................................... 124
2.8.21. DAYPCTL - Daily percentile values ................................................ 125
2.8.22. MONSTAT - Monthly statistical values ............................................ 126
2.8.23. MONPCTL - Monthly percentile values ............................................ 127
2.8.24. YEARMONSTAT - Yearly mean from monthly data .............................. 128
2.8.25. YEARSTAT - Yearly statistical values ............................................. 129
2.8.26. YEARPCTL - Yearly percentile values ............................................ 130
2.8.27. SEASSTAT - Seasonal statistical values ........................................... 131
2.8.28. SEASPCTL - Seasonal percentile values .......................................... 132
2.8.29. YHOURSTAT - Multi-year hourly statistical values ......................... 133
2.8.30. DHOURLSTAT - Multi-day hourly statistical values ......................... 135
2.8.31. YDAYSTAT - Multi-year daily statistical values .............................. 137

1. Introduction

The Climate Data Operator (CDO) software is a collection of many operators for standard processing of climate and forecast model data. The operators include simple statistical and arithmetic functions, data selection and subsampling tools, and spatial interpolation. CDO was developed to have the same set of processing functions for GRIB [GRIB] and NetCDF [NetCDF] datasets in one package.

The Climate Data Interface [CDI] is used for the fast and file format independent access to GRIB and NetCDF datasets. The local MPI-MET data formats SERVICE, EXTRA and IEG are also supported.

There are some limitations for GRIB and NetCDF datasets:

**GRIB** datasets have to be consistent, similar to NetCDF. That means all time steps need to have the same variables, and within a time step each variable may occur only once. Multiple fields in single GRIB2 messages are not supported!

**NetCDF** datasets are only supported for the classic data model and arrays up to 4 dimensions. These dimensions should only be used by the horizontal and vertical grid and the time. The NetCDF attributes should follow the GDT, COARDS or CF Conventions.

The main CDO features are:

- More than 700 operators available
- Modular design and easily extendable with new operators
- Very simple UNIX command line interface
- A dataset can be processed by several operators, without storing the interim results in files
- Most operators handle datasets with missing values
- Fast processing of large datasets
- Support of many different grid types
- Tested on many UNIX/Linux systems, Cygwin, and MacOS-X

1.1. Building from sources

This section describes how to build CDO from the sources on a UNIX system. CDO uses the GNU configure and build system for compilation. The only requirement is a working ISO C++11 and ANSI C99 compiler.

First go to the download page (https://code.mpimet.mpg.de/projects/cdo) to get the latest distribution, if you do not have it yet.

To take full advantage of CDO features the following additional libraries should be installed:

- Unidata NetCDF library (https://www.unidata.ucar.edu/software/netcdf) version 3 or higher. This library is needed to process NetCDF [NetCDF] files with CDO.
- ECMWF ecCodes library (https://software.ecmwf.int/wiki/display/ECC/ecCodes+Home) version 2.3.0 or higher. This library is needed to process GRIB2 files with CDO.
- HDF5 szip library (http://www.hdfgroup.org/doc_resource/SZIP) version 2.1 or higher. This library is needed to process szip compressed GRIB [GRIB] files with CDO.
- HDF5 library (http://www.hdfgroup.org/HDF5) version 1.6 or higher. This library is needed to import CM-SAF [CM-SAF] HDF5 files with the CDO operator import_cmsaf.
• **PROJ** library ([http://trac.osgeo.org/proj](http://trac.osgeo.org/proj)) version 5.0 or higher. This library is needed to convert Sinusoidal and Lambert Azimuthal Equal Area coordinates to geographic coordinates, for e.g. remapping.

• **Magics** library ([https://software.ecmwf.int/wiki/display/MAGP/Magics](https://software.ecmwf.int/wiki/display/MAGP/Magics)) version 2.18 or higher. This library is needed to create contour, vector and graph plots with **CDO**.

**CDO** is a multi-threaded application. Therefor all the above libraries should be compiled thread safe. Using non-threadsafe libraries could cause unexpected errors!

### 1.1.1. Compilation

Compilation is done by performing the following steps:

1. Unpack the archive, if you haven’t done that yet:
   
   ```
   gunzip cdo-$VERSION.tar.gz   # uncompressed the archive
   tar xf cdo-$VERSION.tar      # unpack it
   cd cdo-$VERSION
   ```

2. Run the configure script:
   
   ```
   ./configure
   ```
   
   • Optionaly with NetCDF [NetCDF] support:
     
     ```
     ./configure --with-netcdf=<NetCDF root directory>
     ```
   
   • and with ecCodes:
     
     ```
     ./configure --with-eccodes=<ecCodes root directory>
     ```

   For an overview of other configuration options use
   
   ```
   ./configure --help
   ```

3. Compile the program by running make:
   
   ```
   make
   ```

   The program should compile without problems and the binary (cdo) should be available in the src directory of the distribution.

### 1.1.2. Installation

After the compilation of the source code do a `make install`, possibly as root if the destination permissions require that.

```
make install
```

The binary is installed into the directory `<prefix>/bin`. `<prefix>` defaults to `/usr/local` but can be changed with the `-prefix` option of the configure script.

Alternatively, you can also copy the binary from the src directory manually to some bin directory in your search path.

### 1.2. Usage

This section describes how to use **CDO**. The syntax is:

```
```
1.2.1. Options

All options have to be placed before the first operator. The following options are available for all operators:

-\(a\) Generate an absolute time axis.
-\(b\ <\text{nbits}>\) Set the number of bits for the output precision. The valid precisions depend on the file format:

<table>
<thead>
<tr>
<th>&lt;format&gt;</th>
<th>&lt;nbits&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>grb1, grb2</td>
<td>P1 - P24</td>
</tr>
<tr>
<td>nci, nc2, nc4, nc4c, nc5</td>
<td>I8/I16/I32/F32/F64</td>
</tr>
<tr>
<td>nc4, nc4c, nc5</td>
<td>U8/U16/U32</td>
</tr>
<tr>
<td>grb2, srv, ext, ieg</td>
<td>F32/F64</td>
</tr>
</tbody>
</table>

For srv, ext and ieg format the letter L or B can be added to set the byteorder to Little or Big endian.

-\(--\text{cmor}\) CMOR conform NetCDF output.
-\(--\text{C, --color}\) Colorized output messages.
-\(--\text{ecCodes}\) Use ecCodes to decode/encode GRIB1 messages.
-\(f\ <\text{format}>\) Set the output file format. The valid file formats are:

<table>
<thead>
<tr>
<th>File format</th>
<th>&lt;format&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRIB version 1</td>
<td>grb1/grb</td>
</tr>
<tr>
<td>GRIB version 2</td>
<td>grb2</td>
</tr>
<tr>
<td>NetCDF</td>
<td>nc1</td>
</tr>
<tr>
<td>NetCDF version 2 (64-bit offset)</td>
<td>nc2/nc</td>
</tr>
<tr>
<td>NetCDF-4 (HDF5)</td>
<td>nc4</td>
</tr>
<tr>
<td>NetCDF-4 classic</td>
<td>nc4c</td>
</tr>
<tr>
<td>NetCDF version 5 (64-bit data)</td>
<td>nc5</td>
</tr>
<tr>
<td>SERVICE</td>
<td>srv</td>
</tr>
<tr>
<td>EXTRA</td>
<td>ext</td>
</tr>
<tr>
<td>IEG</td>
<td>ieg</td>
</tr>
</tbody>
</table>

GRIB2 is only available if \text{CDO} was compiled with ecCodes support and all NetCDF file types are only available if \text{CDO} was compiled with NetCDF support!

-\(g\ <\text{grid}>\) Define the default grid description by name or from file (see chapter 1.3 on page 14).
-\(h, --\text{help}\) Help information for the operators.
-\(--\text{no_history}\) Do not append to NetCDF history global attribute.
-\(--\text{netcdf_hdr_pad}, --\text{hdr_pad}, --\text{header_pad} \ <\text{nbr}>\) Pad NetCDF output header with \text{nbr} bytes.
-\(k\ <\text{chunktype}>\) NetCDF4 chunk type: auto, grid or lines.
-\(L\) Lock I/O (sequential access).
-\(M\) Switch to indicate that the I/O streams have missing values.
-\(m\ <\text{missval}>\) Set the missing value of non NetCDF files (default: \(-9e+33\)).
-\(O\) Overwrite existing output file, if checked.
-\(--\text{operators}\) List of all operators.
-\(P\ <\text{ntthreads}>\) Set number of OpenMP threads (Only available if OpenMP support was compiled in).
-\(--\text{pedantic}\) Warnings count as errors.
-\(--\text{percentile} \ <\text{method}>\) Percentile method: nrank nist rtype8 numpy numpy_lower numpy_higher numpy_nearest
-\(--\text{reduce_dim}\) Reduce NetCDF dimensions.
-\(R, --\text{regular}\) Convert GRIB1 data from global reduced to regular Gaussian grid (only with cgribex lib).
-\(r\) Generate a relative time axis.
-\(S\) Create an extra output stream for the module TIMSTAT. This stream contains the number of non missing values for each output period.
-\(s, --\text{silent}\) Silent mode.
-\(--\text{sortname}\) Alphanumeric sorting of NetCDF parameter names.
-t \textless partab\textgreater  Set the GRIB1 (cgribex) default parameter table name or file (see chapter 1.6 on page 19).
Predefined tables are: echam4 echam5 echam6 mpiom1 ecmwf remo
--timestat_date \textless srcdate\textgreater  Target timestamp (temporal statistics): first, middle, midhigh or last source timestep.
-V, --version  Print the version number.
-v, --verbose  Print extra details for some operators.
-w  Disable warning messages.
--worker <num>  Number of worker to decode/decompress GRIB records.
-z zip\{_1-9\}  Deflate compression of NetCDF4 variables.

1.2.2. Environment variables

There are some environment variables which influence the behavior of \texttt{CDO}. An incomplete list can be found in Appendix A.

Here is an example to set the environment variable CDO\_RESET\_HISTORY for different shells:

Bourne shell (sh):  \texttt{CDO\_RESET\_HISTORY=1 ; export CDO\_RESET\_HISTORY}
Korn shell (ksh):  \texttt{export CDO\_RESET\_HISTORY=1}
C shell (csh):  \texttt{setenv CDO\_RESET\_HISTORY 1}

1.2.3. Operators

There are more than 700 operators available. A detailed description of all operators can be found in the Reference Manual section.

1.2.4. Parallelized operators

Some of the \texttt{CDO} operators are shared memory parallelized with OpenMP. An OpenMP-enabled C compiler is needed to use this feature. Users may request a specific number of OpenMP threads \texttt{nthreads} with the \texttt{"-P"} switch.

Here is an example to distribute the bilinear interpolation on 8 OpenMP threads:

\begin{verbatim}
cdo -P 8 remapbil,targetgrid infile outfile
\end{verbatim}

Many \texttt{CDO} operators are I/O-bound. This means most of the time is spend in reading and writing the data. Only compute intensive \texttt{CDO} operators are parallelized. An incomplete list of OpenMP parallelized operators can be found in Appendix B.

1.2.5. Operator parameter

Some operators need one or more parameter. A list of parameter is indicated by the seperator ',',

\begin{itemize}
\item \textbf{STRING}
  String parameters require quotes if the string contains blanks or other characters interpreted by the shell. The following command select variables with the name \texttt{pressure} and \texttt{tsurf}:
  \begin{verbatim}
cdo selvar,pressure,tsurf infile outfile
\end{verbatim}
\item \textbf{FLOAT}
  Floating point number in any representation. The following command sets the range between 0 and 273.15 of all fields to missing value:
  \begin{verbatim}
cdo
\end{verbatim}
\end{itemize}
\[ \text{cdo setrtomiss,0,273.15 infile outfile} \]

- **BOOL**

  Boolean parameter in the following representation TRUE/FALSE, T/F or 0/1. To disable the weighting by grid cell area in the calculation of a field mean, use:

  \[ \text{cdo fldmean,weights=FALSE infile outfile} \]

- **INTEGER**

  A range of integer parameter can be specified by \textit{first}/\textit{last}/\textit{inc}. To select the days 5, 6, 7, 8 and 9 use:

  \[ \text{cdo selday,5/9 infile outfile} \]

  The result is the same as:

  \[ \text{cdo selday,5,6,7,8,9 infile outfile} \]

### 1.2.6. Operator chaining

\textit{Operator chaining} allows to combine two or more operators on the command line into a single \texttt{CDO} call. This allows the creation of complex operations out of more simple ones: reductions over several dimensions, file merges and all kinds of analysis processes. All operators with a fixed number of input streams and one output stream can pass the result directly to an other operator. For differentiation between files and operators all operators must be written with a prepended `-` when chaining.

\[ \text{cdo -monmean -add -mulc,2.0 infile1 -daymean infile2 outfile} \]  
\\\n\text{(CDO example call)}

Here \texttt{monmean} will have the output of \texttt{add} while \texttt{add} takes the output of \texttt{mulc,2.0} and \texttt{daymean}. \texttt{infile1} and \texttt{infile2} are inputs for their predecessor. When mixing operators with an arbitrary number of input streams extra care needs to be taken. The following examples illustrates why.

1. \texttt{cdo info -timavg infile1 infile2}
2. \texttt{cdo info -timavg infile?}
3. \texttt{cdo timavg infile1 tmpfile}
   \texttt{cdo info tmpfile infile2}
   \texttt{rm tmpfile}

All three examples produce identical results. The time average will be computed only on the first input file.

\textbf{Note(1):} In section 1.3.2 we introduce argument groups which will make this a lot easier and less error prone.

\textbf{Note(2):} Operator chaining is implemented over POSIX Threads (pthreads). Therefore this \texttt{CDO} feature is not available on operating systems without POSIX Threads support!

### 1.2.7. Chaining Benefits

Combining operators can have several benefits. The most obvious is a performance increase through reducing disk I/O:

\[ \text{cdo sub -dayavg infile2 -timavg infile1 outfile} \]

instead of

\[ \text{cdo timavg infile1 tmp1} \]
\[ \text{cdo dayavg infile2 tmp2} \]
\[ \text{cdo sub tmp2 tmp1 outfile} \]
\[ \text{rm tmp1 tmp2} \]
Especially with large input files the reading and writing of intermediate files can have a big influence on the overall performance.
A second aspect is the execution of operators: Limited by the algorithms potentially all operators of a chain can run in parallel.

1.3. Advanced Usage

In this section we will introduce advanced features of CDO. These include operator grouping which allows to write more complex CDO calls and the apply keyword which allows to shorten calls that need an operator to be executed on multiple files as well as wildcards which allow to search paths for file signatures. These features have several restrictions and follow rules that depend on the input/output properties. These required properties of operators can be investigated with the following commands which will output a list of operators that have selected properties:

```
cdo --attribs [arbitrary/filesOnly/onlyFirst/noOutput/obase]
```

- **arbitrary** describes all operators where the number of inputs is not defined.
- **filesOnly** are operators that can have other operators as input.
- **onlyFirst** shows which operators can only be at the most left position of the polish notation argument chain.
- **noOutput** are all operators that do not print to any file (e.g info)
- **obase** Here obase describes an operator that does not use the output argument as file but e.g as a file name base (output base). This is almost exclusively used for operators the split input files.

```
cdo -splithour baseName_ could result in: baseName_1 baseName_2 ... baseName_N
```

For checking a single or multiple operator directly the following usage of –attribs can be used:

```
cdo --attribs operatorName
```

1.3.1. Wildcards

Wildcards are a standard feature of command line interpreters (shells) on many operating systems. They are placeholder characters used in file paths that are expanded by the interpreter into file lists. For further information the Advance Bash Scripting Guide is a valuable source of information. Handling of input is a central issue for CDO and in some circumstances it is not enough to use the wildcards from the shell. That’s why CDO can handle them on its own.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>wildcard filelist</td>
<td>results</td>
</tr>
<tr>
<td>2020-3* and 2020-3-???.txt</td>
<td>2020-3-01.txt 2020-3-02.txt 2020-3-12.txt 2020-3-13.txt 2020-3-15.txt</td>
</tr>
<tr>
<td>2020-3-?1.txt</td>
<td>2020-3-01.txt</td>
</tr>
<tr>
<td>*.grb</td>
<td>2021.grb 2022.grb</td>
</tr>
</tbody>
</table>

Use single quotes if the input stream names matched to a single wildcard expression. In this case CDO will do the pattern matching and the output can be combined with other operators. Here is an example for this feature:

```
cdo timavg -select,name=temperature 'infill?' outfile
```

In earlier versions of CDO this was necessary to have the right files parsed to the right operator. Newer version support this with the argument grouping feature (see 1.3.2). We advice the use of the grouping mechanism instead of the single quoted wildcards since this feature could be deprecated in future versions.

**Note:** Wildcard expansion is not available on operating systems without the `glob()` function!
1.3.2. Argument Groups

In section 1.2.6 we described that it is not possible to chain operators with an arbitrary number of inputs. In this section we want to show how this can be achieved through the use of operator grouping with angled brackets [ ]. Using these brackets CDO can assign the inputs to their corresponding operators during the execution of the command line. The ability to write operator combination in a parenthesis-free way is partly given up in favor of allowing operators with arbitrary number of inputs. This allows a much more compact way to handle large number of input files.

The following example shows an example which we will transform from a non-working solution to a working one.

\[
\text{cdo -infn -div -fldmean -cat \{ infile1 -mulc,2.0 infile2 \} -fldmax infile3}
\]

This example will throw the following error:

\[
\text{cdo (Warning): Did you forget to use \[ \] and/or \] for multiple variable input operators?}
\]

\[
\text{cdo (Warning): use option --variableInput, for description}
\]

\[
\text{cdo (Abort): Too few streams specified! Operator div needs 2 input streams and 1 output stream!}
\]

The error is raised by the operator div. This operator needs two input streams and one output stream, but the cat operator has claimed all possible streams on its right hand side as input because it accepts an arbitrary number of inputs. Hence it didn’t leave anything for the remaining input or output streams of div. For this we can declare a group which will be passed to the operator left of the group.

\[
\text{cdo -infn -div -fldmean -cat \{ infile1 -mulc,2.0 infile2 \} -fldmax infile3}
\]

For full flexibility it is possible to have groups inside groups:

\[
\text{cdo -infn -div -fldmean -cat \{ fileA1 infileC2 -merge \{ infileB1 infileB2 \} \} -fldmax infileD}
\]

1.3.3. Apply Keyword

When working with medium or large number of similar files there is a common problem of a processing step (often a reduction) which needs to be performed on all of them before a more specific analysis can be applied. Usually this can be done in two ways: One option is to use merge to glue everything together and chain the reduction step after it. The second option is to write a for-loop over all inputs which perform the basic processing on each of the files separately and call merge one the results. Unfortunately both options have side-effects: The first one needs a lot of memory because all files are read in completely and reduced afterwards while the latter one creates a lot of temporary files. Both memory and disk IO can be bottlenecks and should be avoided.

The apply keyword was introduced for that purpose. It can be used as an operator, but it needs at least one operator as a parameter, which is applied in parallel to all related input streams before all streams are passed to operator next in the chain.

The following is an example with three input files:

\[
\text{cdo -merge -apply,-daymean \{ file1 file2 file3 \} outfile}
\]

would result in:

\[
\text{cdo -merge -daymean file1 -daymean file2 -daymean file3 outfile}
\]

Apply is especially useful when combined with wildcards. The previous example can be shortened further.
cdo -merge -apply,-daymean [ file? ] outfile

As shown this feature allows to simplify commands with medium amount of files and to move reductions further back. This can also have a positive impact on the performance.

An example where performance can take a hit.

```bash
cdo -yearmean -daymean -merge [ f1 ... f40 ]
```

An improved but ugly to write example.

```bash
cdo -yearmean -merge [ -daymean f1 -daymean f2 ... -daymean f40 ]
```

Apply saves the day. And creates the call above with much less typing.

```bash
cdo -yearmean -merge [ -apply,-daymean [ f1 ... f40 ] ]
```

Figure 1.2.: Apply keyword simplifies command and execution

In the example in figure 1.2 the resulting call will dramatically save process interaction as well as execution times since the reduction (daymean) is applied on the files first. That means that the merge operator will receive the reduced files and the operations for merging the whole data is saved. For other CDO calls further improvements can be made by adding more arguments to apply (1.3)

A less performant example.

```bash
cdo -aReduction -anotherReduction -daymean -merge [ f1 ... f40 ]
```

```bash
cdo -merge -apply,"-aReduction -anotherReduction -daymean" [ f1 ... f40 ]
```

Figure 1.3.: Multi argument apply

**Restrictions:** While the apply keyword can be extremely helpful it has several restrictions (for now!).

- Apply inputs can only be files, wildcards and operators that have 0 inputs and 1 output.
- Apply can not be used as the first CDO operator.
- Apply arguments can only be operators with 1 input and 1 output.
- Grouping inside the Apply argument or input is not allowed.

### 1.4. Horizontal grids

Physical quantities of climate models are typically stored on a horizontal grid. CDO supports structured grids like regular lon/lat or curvilinear grids and also unstructured grids.

#### 1.4.1. Grid area weights

One single point of a horizontal grid represents the mean of a grid cell. These grid cells are typically of different sizes, because the grid points are of varying distance.
Area weights are individual weights for each grid cell. They are needed to compute the area weighted mean or variance of a set of grid cells (e.g. \texttt{fldmean} - the mean value of all grid cells). In \texttt{CDO} the area weights are derived from the grid cell area. If the cell area is not available then it will be computed from the geographical coordinates via spherical triangles. This is only possible if the geographical coordinates of the grid cell corners are available or derivable. Otherwise \texttt{CDO} gives a warning message and uses constant area weights for all grid cells.

The cell area is read automatically from a NetCDF input file if a variable has the corresponding “\texttt{cell\_measures}” attribute, e.g.:

\begin{verbatim}
var:cell\_measures = "area: cell\_area" ;
\end{verbatim}

If the computed cell area is not desired then the \texttt{CDO} operator \texttt{setgridarea} can be used to set or overwrite the grid cell area.

### 1.4.2. Grid description

In the following situations it is necessary to give a description of a horizontal grid:

- Changing the grid description (operator: \texttt{setgrid})
- Horizontal interpolation (all remapping operators)
- Generating of variables (operator: \texttt{const, random})

As now described, there are several possibilities to define a horizontal grid.

#### 1.4.2.1. Predefined grids

Predefined grids are available for global regular, gaussian or icosahedral-hexagonal GME grids.

**Global regular grid: global\_<DXY>**

\texttt{global\_<DXY>} defines a global regular lon/lat grid. The grid increment \texttt{<DXY>} can be selected at will. The longitudes start at \texttt{<DXY>/2 - 180°} and the latitudes start at \texttt{<DXY>/2 - 90°}.

**Global regular grid: r\,<NX>\times<NY>**

\texttt{r\,<NX>\times<NY>} defines a global regular lon/lat grid. The number of the longitudes \texttt{<NX>} and the latitudes \texttt{<NY>} can be selected at will. The longitudes start at \texttt{0°} with an increment of \texttt{(360/<NX>)°}. The latitudes go from south to north with an increment of \texttt{(180/<NY>)°}.

**One grid point: lon=<LON>/lat=<LAT>**

\texttt{lon=<LON>/lat=<LAT>} defines a lon/lat grid with only one grid point.

**Full regular Gaussian grid: F\,<XXX>**

\texttt{F\,<XXX>} defines a global regular Gaussian grid. \texttt{XXX} specifies the number of latitudes lines between the Pole and the Equator. The longitudes start at \texttt{0°} with an increment of \texttt{(360/nlon)°}. The gaussian latitudes go from north to south.

**Global icosahedral-hexagonal GME grid: gme\,<NI>**

\texttt{gme\,<NI>} defines a global icosahedral-hexagonal GME grid. \texttt{NI} specifies the number of intervals on a main triangle side.
1.4.2.2. Grids from data files

You can use the grid description from an other datafile. The format of the datafile and the grid of the data field must be supported by CDO. Use the operator ‘sinfo’ to get short informations about your variables and the grids. If there are more then one grid in the datafile the grid description of the first variable will be used. Add the extension :N to the name of the datafile to select grid number N.

1.4.2.3. SCRIP grids

SCRIP (Spherical Coordinate Remapping and Interpolation Package) uses a common grid description for curvilinear and unstructured grids. For more information about the convention see [SCRIP]. This grid description is stored in NetCDF. Therefore it is only available if CDO was compiled with NetCDF support!

SCRIP grid description example of a curvilinear MPIOM [MPIOM] GROB3 grid (only the NetCDF header):

```netcdf grob3s {
    dimensions:
        grid_size = 12120 ;
        grid_corners = 4 ;
        grid_rank = 2 ;
    variables:
        int grid_dima(grid_rank) ;
        double grid_center_lat(grid_size) ;
        grid_center_lat:units = "degrees" ;
        grid_center_lat:bounds = "grid_corner_lat" ;
        double grid_center_lon(grid_size) ;
        grid_center_lon:units = "degrees" ;
        grid_center_lon:bounds = "grid_corner_lon" ;
        int grid_imask(grid_size) ;
        grid_imask:units = "unitless" ;
        grid_imask:coordinates = "grid_center_lon grid_center_lat" ;
        double grid_corner_lat(grid_size, grid_corners) ;
        grid_corner_lat:units = "degrees" ;
        double grid_corner_lon(grid_size, grid_corners) ;
        grid_corner_lon:units = "degrees" ;

    // global attributes:
    :title = "grob3s" ;
}
```

1.4.2.4. CDO grids

All supported grids can also be described with the CDO grid description. The following keywords can be used to describe a grid:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gridtype</td>
<td>STRING</td>
<td>Type of the grid (gaussian, lonlat, curvilinear, unstructured).</td>
</tr>
<tr>
<td>gridsize</td>
<td>INTEGER</td>
<td>Size of the grid.</td>
</tr>
<tr>
<td>xsize</td>
<td>INTEGER</td>
<td>Size in x direction (number of longitudes).</td>
</tr>
<tr>
<td>ysize</td>
<td>INTEGER</td>
<td>Size in y direction (number of latitudes).</td>
</tr>
<tr>
<td>xvals</td>
<td>FLOAT ARRAY</td>
<td>X values of the grid cell center.</td>
</tr>
<tr>
<td>yvals</td>
<td>FLOAT ARRAY</td>
<td>Y values of the grid cell center.</td>
</tr>
<tr>
<td>nvertex</td>
<td>INTEGER</td>
<td>Number of the vertices for all grid cells.</td>
</tr>
<tr>
<td>xbounds</td>
<td>FLOAT ARRAY</td>
<td>X bounds of each gridbox.</td>
</tr>
<tr>
<td>ybounds</td>
<td>FLOAT ARRAY</td>
<td>Y bounds of each gridbox.</td>
</tr>
<tr>
<td>xfirst, xinc</td>
<td>FLOAT, FLOAT</td>
<td>Macros to define xvals with a constant increment, xfirst is the x value of the first grid cell center.</td>
</tr>
<tr>
<td>yfirst, yinc</td>
<td>FLOAT, FLOAT</td>
<td>Macros to define yvals with a constant increment, yfirst is the y value of the first grid cell center.</td>
</tr>
<tr>
<td>xunits</td>
<td>STRING</td>
<td>units of the x axis</td>
</tr>
<tr>
<td>yunits</td>
<td>STRING</td>
<td>units of the y axis</td>
</tr>
</tbody>
</table>
Which keywords are necessary depends on the gridtype. The following table gives an overview of the default values or the size with respect to the different grid types.

<table>
<thead>
<tr>
<th>gridtype</th>
<th>lonlat</th>
<th>gaussian</th>
<th>projection</th>
<th>curvilinear</th>
<th>unstructured</th>
</tr>
</thead>
<tbody>
<tr>
<td>gridsize</td>
<td>xsize*ysize</td>
<td>xsize*ysize</td>
<td>xsize*ysize</td>
<td>xsize*ysize</td>
<td>ncell</td>
</tr>
<tr>
<td>xsize</td>
<td>nlon</td>
<td>nlon</td>
<td>nx</td>
<td>nlon</td>
<td>gridsize</td>
</tr>
<tr>
<td>ysize</td>
<td>nlat</td>
<td>nlat</td>
<td>ny</td>
<td>nlat</td>
<td>gridsize</td>
</tr>
<tr>
<td>xvals</td>
<td>xsize</td>
<td>xsize</td>
<td>xsize</td>
<td>gridsize</td>
<td>gridsize</td>
</tr>
<tr>
<td>yvals</td>
<td>ysize</td>
<td>ysize</td>
<td>ysize</td>
<td>gridsize</td>
<td>gridsize</td>
</tr>
<tr>
<td>nvertex</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>4</td>
<td>nv</td>
</tr>
<tr>
<td>xbounds</td>
<td>2*xsize</td>
<td>2*xsize</td>
<td>2*xsize</td>
<td>4*gridsize</td>
<td>nv*gridsize</td>
</tr>
<tr>
<td>ybounds</td>
<td>2*ysize</td>
<td>2*ysize</td>
<td>2*ysize</td>
<td>4*gridsize</td>
<td>nv*gridsize</td>
</tr>
<tr>
<td>xunits</td>
<td>degrees</td>
<td>degrees</td>
<td>m</td>
<td>degrees</td>
<td>degrees</td>
</tr>
<tr>
<td>yunits</td>
<td>degrees</td>
<td>degrees</td>
<td>m</td>
<td>degrees</td>
<td>degrees</td>
</tr>
</tbody>
</table>

The keywords nvertex, xbounds and ybounds are optional if area weights are not needed. The grid cell corners xbounds and ybounds have to rotate counterclockwise.

**CDO grid description example of a T21 gaussian grid:**

```
gridtype = gaussian
xsize = 64
ysize = 32
xfirst = 0
xinc = 5.625
yvals = 85.76 80.27 74.75 69.21 63.68 58.14 52.61 47.07
        41.53 36.00 30.46 24.92 19.38 13.84 8.31 2.77
        -2.77 -8.31 -13.84 -19.38 -24.92 -30.46 -36.00 -41.53
        -47.07 -52.61 -58.14 -63.68 -69.21 -74.75 -80.27 -85.76
```

**CDO grid description example of a global regular grid with 60x30 points:**

```
gridtype = lonlat
xsize = 60
ysize = 30
xfirst = -177
xinc = 6
yfirst = -87
yinc = 6
```

The description for a projection is somewhat more complicated. Use the first section to describe the coordinates of the projection with the above keywords. Add the keyword `grid_mapping_name` to describe the mapping between the given coordinates and the true latitude and longitude coordinates. `grid_mapping_name` takes a string value that contains the name of the projection. A list of attributes can be added to define the mapping. The name of the attributes depend on the projection. The valid names of the projection and there attributes follow the NetCDF CF-Convention.

**CDO supports the special grid mapping attribute proj_params.** These parameter will be passed directly to the PROJ library to generate the geographic coordinates if needed.

The geographic coordinates of the following projections can be generated without the attribute `proj_params`, if all other attributes are available:

- rotated_latitude_longitude
- lambert_conformal_conic
- lambert_azimuthal_equal_area
- sinusoidal
- polar_stereographic
It is recommended to set the attribute `proj_params` also for the above projections to make sure all PROJ parameter are set correctly.

Here is an example of a CDO grid description using the attribute `proj_params` to define the PROJ parameter of a polar stereographic projection:

```
gridtype = projection
xsize = 11
ysize = 11
xunits = 'meter'
yunits = 'meter'
xfirst = -638000
xinc = 150
yfirst = -3349350
yinc = 150
grid_mapping = crs
grid_mapping_name = polar_stereographic
proj_params = '+proj=stere +lon_0=45 +lat_ts=70 +lat_0=90 +x_0=0 +y_0=0'
```

The result is the same as using the CF conform Grid Mapping Attributes:

```
gridtype = projection
xsize = 11
ysize = 11
xunits = 'meter'
yunits = 'meter'
xfirst = -638000
xinc = 150
yfirst = -3349350
yinc = 150
grid_mapping = crs
grid_mapping_name = polar_stereographic
straight_vertical_longitude_from_pole = 45.
standard_parallel = 70.
latitude_of_projection_origin = 90.
false_easting = 0.
false_northing = 0.
```

CDO grid description example of a regional rotated lon/lat grid:

```
gridtype = projection
xsize = 81
ysize = 91
xunits = 'degrees'
yunits = 'degrees'
xfirst = -10.5
xinc = 0.5
yfirst = -25.0
yinc = 0.5
grid_mapping_name = rotated_latitude_longitude
grid_north_pole_longitude = 170
grid_north_pole_latitude = 32.5
```

Example CDO descriptions of a curvilinear and an unstructured grid can be found in Appendix D.

### 1.4.3. ICON - Grid File Server

The geographic coordinates of the ICON model are located on an unstructured grid. This grid is stored in a separate grid file independent of the model data. The grid files are made available to the general public via a file server. Furthermore, these grid files are located at DKRZ under `/pool/data/ICON/grids`.

With the CDO function `setgrid,<gridfile>` this grid information can be added to the data if needed. Here is an example:

```
cdo sellonlatbox,-20,60,10,70 -setgrid,<path_to_gridfile> icondatafile result
```
ICON model data in NetCDF format contains the global attribute `grid_file_uri`. This attribute contains a link to the appropriate grid file on the ICON grid file server. If the global attribute `grid_file_uri` is present and valid, the grid information is added automatically. The `setgrid` function is then no longer necessary. 

CDO evaluates this attribute and downloads the grid file on demand if it is not already present. The grid file is stored in the current directory. The environment variable `CDO_DOWNLOAD_PATH` can be used to select a different directory for storing the grid file.

If the grid files are available locally, like at DKRZ, they do not need to be fetched from the grid file server. Use the environment variable `CDO_ICON_GRIDS` to set the root directory of the ICON grids. Here is an example for the ICON grids at DKRZ:

```
CDO_ICON_GRIDS=/pool/data/ICON
```

### 1.5. Z-axis description

Sometimes it is necessary to change the description of a z-axis. This can be done with the operator `setzaxis`. This operator needs an ASCII formatted file with the description of the z-axis. The following keywords can be used to describe a z-axis:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zaxistype</td>
<td>STRING</td>
<td>type of the z-axis</td>
</tr>
<tr>
<td>size</td>
<td>INTEGER</td>
<td>number of levels</td>
</tr>
<tr>
<td>levels</td>
<td>FLOAT ARRAY</td>
<td>values of the levels</td>
</tr>
<tr>
<td>lbounds</td>
<td>FLOAT ARRAY</td>
<td>lower level bounds</td>
</tr>
<tr>
<td>ubounds</td>
<td>FLOAT ARRAY</td>
<td>upper level bounds</td>
</tr>
<tr>
<td>vctsize</td>
<td>INTEGER</td>
<td>number of vertical coordinate parameters</td>
</tr>
<tr>
<td>vct</td>
<td>FLOAT ARRAY</td>
<td>vertical coordinate table</td>
</tr>
</tbody>
</table>

The keywords `lbounds` and `ubounds` are optional. `vctsize` and `vct` are only necessary to define hybrid model levels.

Available z-axis types:

<table>
<thead>
<tr>
<th>Z-axis type</th>
<th>Description</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>surface</td>
<td>Surface</td>
<td></td>
</tr>
<tr>
<td>pressure</td>
<td>Pressure level</td>
<td>pascal</td>
</tr>
<tr>
<td>hybrid</td>
<td>Hybrid model level</td>
<td></td>
</tr>
<tr>
<td>height</td>
<td>Height above ground</td>
<td>meter</td>
</tr>
<tr>
<td>depth_below_sea</td>
<td>Depth below sea level</td>
<td>meter</td>
</tr>
<tr>
<td>depth_below_land</td>
<td>Depth below land surface</td>
<td>centimeter</td>
</tr>
<tr>
<td>isentropic</td>
<td>Isentropic (theta) level</td>
<td>kelvin</td>
</tr>
</tbody>
</table>

Z-axis description example for pressure levels 100, 200, 500, 850 and 1000 hPa:

```
zaxistype = pressure
size     = 5
levels   = 10000 20000 50000 85000 100000
```

Z-axis description example for ECHAM5 L19 hybrid model levels:

```
zaxistype = hybrid
size     = 19
levels   = 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19
vctsize  = 40
vct      = 0 2000 4000 6046.10938 8267.92578 10609.5117 12851.1016 14698.5 15861.125 16116.2383 15356.9258 13621.4609 11101.5625 8127.14453 5125.14062 2549.96875 783.195068 0 0 0
```
Note that the vctsize is twice the number of levels plus two and the vertical coordinate table must be specified for the level interfaces.

1.6. Time axis

A time axis describes the time for every timestep. Two time axis types are available: absolute time and relative time axis. **CDO** tries to maintain the actual type of the time axis for all operators.

1.6.1. Absolute time

An absolute time axis has the current time to each time step. It can be used without knowledge of the calendar. This is preferably used by climate models. In NetCDF files the absolute time axis is represented by the unit of the time: "day as %Y%m%d.%f".

1.6.2. Relative time

A relative time is the time relative to a fixed reference time. The current time results from the reference time and the elapsed interval. The result depends on the calendar used. **CDO** supports the standard Gregorian, proleptic Gregorian, 360 days, 365 days and 366 days calendars. The relative time axis is preferably used by numerical weather prediction models. In NetCDF files the relative time axis is represented by the unit of the time: "time-units since reference-time", e.g. "days since 1989-6-15 12:00".

1.6.3. Conversion of the time

Some programs which work with NetCDF data can only process relative time axes. Therefore it may be necessary to convert from an absolute into a relative time axis. This conversion can be done for each operator with the **CDO** option '-r'. To convert a relative into an absolute time axis use the **CDO** option '-a'.

1.7. Parameter table

A parameter table is an ASCII formated file to convert code numbers to variable names. Each variable has one line with its code number, name and a description with optional units in a blank separated list. It can only be used for GRIB, SERVICE, EXTRA and IEG formated files. The **CDO** option '-t <partab>' sets the default parameter table for all input files. Use the operator 'setpartab' to set the parameter table for a specific file.

Example of a **CDO** parameter table:

<table>
<thead>
<tr>
<th>Code</th>
<th>Code</th>
<th>Description</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>134</td>
<td>aps</td>
<td>surface pressure</td>
<td>[Pa]</td>
</tr>
<tr>
<td>141</td>
<td>sn</td>
<td>snow depth</td>
<td>[m]</td>
</tr>
<tr>
<td>147</td>
<td>ahfl</td>
<td>latent heat flux</td>
<td>[W/m²]</td>
</tr>
<tr>
<td>172</td>
<td>slm</td>
<td>land sea mask</td>
<td></td>
</tr>
<tr>
<td>175</td>
<td>albedo</td>
<td>surface albedo</td>
<td></td>
</tr>
<tr>
<td>211</td>
<td>siced</td>
<td>ice depth</td>
<td>[m]</td>
</tr>
</tbody>
</table>
1.8. Missing values

Missing values are data points that are missing or invalid. Such data points are treated in a different way than valid data. Most CDO operators can handle missing values in a smart way. But if the missing value is within the range of valid data, it can lead to incorrect results. This applies to all arithmetic operations, but especially to logical operations when the missing value is 0 or 1.

The default missing value for GRIB, SERVICE, EXTRA and IEG files is \(-9.e^{33}\). The CDO option `-m <missval>` overwrites the default missing value. In NetCDF files the variable attribute `"_FillValue"` is used as a missing value. The operator `setmissval` can be used to set a new missing value.

The CDO use of the missing value is shown in the following tables, where one table is printed for each operation. The operations are applied to arbitrary numbers \(a\), \(b\), the special case 0, and the missing value \(\text{miss}\). For example the table named "addition" shows that the sum of an arbitrary number \(a\) and the missing value is the missing value, and the table named "multiplication" shows that 0 multiplied by missing value results in 0.

<table>
<thead>
<tr>
<th>Operation</th>
<th>b</th>
<th>miss</th>
</tr>
</thead>
<tbody>
<tr>
<td>addition</td>
<td>(a + b)</td>
<td>\text{miss}</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>subtraction</td>
<td>(a - b)</td>
<td>\text{miss}</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>multiplication</td>
<td>0</td>
<td>\text{miss}</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>division</td>
<td>(a/b)</td>
<td>\text{miss}</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>maximum</td>
<td>(\max(a,b))</td>
<td>(a)</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>minimum</td>
<td>(\min(a,b))</td>
<td>(a)</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
<tr>
<td>sum</td>
<td>(a + b)</td>
<td>\text{miss}</td>
</tr>
<tr>
<td></td>
<td>\text{miss}</td>
<td>\text{miss}</td>
</tr>
</tbody>
</table>

The handling of missing values by the operations "minimum" and "maximum" may be surprising, but the definition given here is more consistent with that expected in practice. Mathematical functions (e.g. \(\log\), \(\sqrt{}\), etc.) return the missing value if an argument is the missing value or an argument is out of range.

All statistical functions ignore missing values, treading them as not belonging to the sample, with the side-effect of a reduced sample size.

1.8.1. Mean and average

An artificial distinction is made between the notions mean and average. The mean is regarded as a statistical function, whereas the average is found simply by adding the sample members and dividing the result by the sample size. For example, the mean of 1, 2, \text{miss} and 3 is \((1 + 2 + \text{miss} + 3)/3 = 2\), whereas the average is \((1 + 2 + \text{miss} + 3)/4 = \text{miss}/4 = \text{miss}\). If there are no missing values in the sample, the average and mean are identical.
1.9. Percentile

There is no standard definition of percentile. All definitions yield to similar results when the number of values is very large. The following percentile methods are available in CDO:

<table>
<thead>
<tr>
<th>Percentile method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nrank</td>
<td>Nearest Rank method, the default method used in CDO</td>
</tr>
<tr>
<td>nist</td>
<td>The primary method recommended by NIST</td>
</tr>
<tr>
<td>rtype8</td>
<td>R’s type=8 method</td>
</tr>
<tr>
<td>numpy</td>
<td>numpy.percentile with the option interpolation set to ‘linear’</td>
</tr>
<tr>
<td>numpy_lower</td>
<td>numpy.percentile with the option interpolation set to ‘lower’</td>
</tr>
<tr>
<td>numpy_higher</td>
<td>numpy.percentile with the option interpolation set to ‘higher’</td>
</tr>
<tr>
<td>numpy_nearest</td>
<td>numpy.percentile with the option interpolation set to ‘nearest’</td>
</tr>
</tbody>
</table>

The percentile method can be selected with the CDO option --percentile. The Nearest Rank method is the default percentile method in CDO.

The different percentile methods can lead to different results, especially for small number of data values. Consider the ordered list \(\{15, 20, 35, 40, 50, 55\}\), which contains six data values. Here is the result for the 30th, 40th, 50th, 75th and 100th percentiles of this list using the different percentile methods:

<table>
<thead>
<tr>
<th>Percentile P</th>
<th>nrank</th>
<th>nist</th>
<th>rtype8</th>
<th>numpy</th>
<th>numpy_lower</th>
<th>numpy_higher</th>
<th>numpy_nearest</th>
</tr>
</thead>
<tbody>
<tr>
<td>30th</td>
<td>20</td>
<td>21.5</td>
<td>23.5</td>
<td>27.5</td>
<td>20</td>
<td>35</td>
<td>35</td>
</tr>
<tr>
<td>40th</td>
<td>35</td>
<td>32</td>
<td>33</td>
<td>35</td>
<td>35</td>
<td>35</td>
<td>35</td>
</tr>
<tr>
<td>50th</td>
<td>35</td>
<td>37.5</td>
<td>37.5</td>
<td>37.5</td>
<td>35</td>
<td>40</td>
<td>40</td>
</tr>
<tr>
<td>75th</td>
<td>50</td>
<td>51.25</td>
<td>50.42</td>
<td>47.5</td>
<td>40</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>100th</td>
<td>55</td>
<td>55</td>
<td>55</td>
<td>55</td>
<td>55</td>
<td>55</td>
<td>55</td>
</tr>
</tbody>
</table>

1.9.1. Percentile over timesteps

The amount of data for time series can be very large. All data values need to held in memory to calculate the percentile. The percentile over timesteps uses a histogram algorithm, to limit the amount of required memory. The default number of histogram bins is 101. That means the histogram algorithm is used, when the dataset has more than 101 time steps. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The histogram algorithm is implemented only for the Nearest Rank method.
2. Reference manual

This section gives a description of all operators. Related operators are grouped to modules. For easier
description all single input files are named infile or infile1, infile2, etc., and an arbitrary number of
input files are named infiles. All output files are named outfile or outfile1, outfile2, etc. Further
the following notion is introduced:

\[ i(t) \quad \text{Timestep } t \text{ ofinfile} \]
\[ i(t,x) \quad \text{Element number } x \text{ of the field at timestep } t \text{ of infile} \]
\[ o(t) \quad \text{Timestep } t \text{ of outfile} \]
\[ o(t,x) \quad \text{Element number } x \text{ of the field at timestep } t \text{ of outfile} \]
2.1. Information

This section contains modules to print information about datasets. All operators print their results to standard output.

Here is a short overview of all operators in this section:

- **info**: Dataset information listed by parameter identifier
- **infon**: Dataset information listed by parameter name
- **map**: Dataset information and simple map
- **sinfo**: Short information listed by parameter identifier
- **sinfon**: Short information listed by parameter name
- **diff**: Compare two datasets listed by parameter id
- **diffn**: Compare two datasets listed by parameter name
- **npar**: Number of parameters
- **nlevel**: Number of levels
- **nyear**: Number of years
- **nmon**: Number of months
- **ndate**: Number of dates
- **ntime**: Number of timesteps
- **ngridpoints**: Number of gridpoints
- **ngrids**: Number of horizontal grids
- **showformat**: Show file format
- **showcode**: Show code numbers
- **showname**: Show variable names
- **showstdname**: Show standard names
- **showlevel**: Show levels
- **showltype**: Show GRIB level types
- **showyear**: Show years
- **showmon**: Show months
- **showdate**: Show date information
- **showtime**: Show time information
- **showtimestamp**: Show timestamp
- **showattribute**: Show a global attribute or a variable attribute
- **partab**: Parameter table
- **codetab**: Parameter code table
- **griddes**: Grid description
- **zaxisdes**: Z-axis description
- **vct**: Vertical coordinate table
2.1.1. INFO - Information and simple statistics

Synopsis

<operator> infiles

Description

This module writes information about the structure and contents for each field of all input files to standard output. A field is a horizontal layer of a data variable. All input files need to have the same structure with the same variables on different timesteps. The information displayed depends on the chosen operator.

Operators

info

Dataset information listed by parameter identifier
Prints information and simple statistics for each field of all input datasets. For each field the operator prints one line with the following elements:

- Date and Time
- Level, Gridsize and number of Missing values
- Minimum, Mean and Maximum
  The mean value is computed without the use of area weights!
- Parameter identifier

infon

Dataset information listed by parameter name
The same as operator info but using the name instead of the identifier to label the parameter.

map

Dataset information and simple map
Prints information, simple statistics and a map for each field of all input datasets. The map will be printed only for fields on a regular lon/lat grid.

Example

To print information and simple statistics for each field of a dataset use:

```
cdo infon infile
```

This is an example result of a dataset with one 2D parameter over 12 timesteps:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
2.1.2. SINFO - Short information

Synopsis

\(<\text{operator}>\) infiles

Description

This module writes information about the structure of infiles to standard output. infiles is an arbitrary number of input files. All input files need to have the same structure with the same variables on different timesteps. The information displayed depends on the chosen operator.

Operators

\textbf{sinfo}\quad Short information listed by parameter identifier

Prints short information of a dataset. The information is divided into 4 sections. Section 1 prints one line per parameter with the following information:

- institute and source
- time c=constant v=varying
- type of statistical processing
- number of levels and z-axis number
- horizontal grid size and number
- data type
- parameter identifier

Section 2 and 3 gives a short overview of all grid and vertical coordinates. And the last section contains short information of the time coordinate.

\textbf{sinfon}\quad Short information listed by parameter name

The same as operator \textbf{sinfo} but using the name instead of the identifier to label the parameter.

Example

To print short information of a dataset use:

\texttt{cdo infon infile}

This is the result of an ECHAM5 dataset with 3 parameter over 12 timesteps:

<table>
<thead>
<tr>
<th>\textbf{Parameter}</th>
<th>\textbf{Institute}</th>
<th>\textbf{Source}</th>
<th>\textbf{Type}</th>
<th>\textbf{Levels}</th>
<th>\textbf{Points}</th>
<th>\textbf{Dtype}</th>
<th>\textbf{Name}</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>MPIMET</td>
<td>ECHAM5</td>
<td>c instant</td>

<td>F32</td>
<td>GEOSP</td>
</tr>
<tr>
<td>2</td>
<td>MPIMET</td>
<td>ECHAM5</td>
<td>v instant</td>
<td>4</td>
<td>2</td>
<td>F32</td>
<td>T</td>
</tr>
<tr>
<td>3</td>
<td>MPIMET</td>
<td>ECHAM5</td>
<td>v instant</td>
<td>1</td>
<td>1</td>
<td>F32</td>
<td>TSURF</td>
</tr>
</tbody>
</table>

Grid coordinates:

- \texttt{points=2048} (64x32) \texttt{F16}
- \texttt{longitude: 0 to 354.375 by 5.625 degrees_east} \texttt{circular}
- \texttt{latitude: 85.7606 to -85.7606 degrees_north}

Vertical coordinates:

- \texttt{levels=1}
- \texttt{levels=4}
- \texttt{level: 92500 to 20000 Pa}

Time coordinate: 12 steps

<table>
<thead>
<tr>
<th>YYYY-MM-DD</th>
<th>hh:mm:ss</th>
</tr>
</thead>
<tbody>
<tr>
<td>1987-01-31</td>
<td>12:00:00</td>
</tr>
<tr>

</tr>
<tr>
<td>1987-11-30</td>
<td>12:00:00</td>
</tr>
<tr>
<td>1987-12-31</td>
<td>12:00:00</td>
</tr>
</tbody>
</table>
2.1.3. DIFF - Compare two datasets field by field

Synopsis

\(<\text{operator}>[,\text{options}]\ \text{infile1 infile2}\)

Description

Compares the contents of two datasets field by field. The input datasets need to have the same structure and its fields need to have the same header information and dimensions. Try the option \textit{names} if the number of variables differ. Exit status is 0 if inputs are the same and 1 if they differ.

Operators

\textbf{diff} \quad \text{Compare two datasets listed by parameter id}

Provides statistics on differences between two datasets. For each pair of fields the operator prints one line with the following information:

- Date and Time
- Level, Gridsize and number of Missing values
- Number of different values
- Occurrence of coefficient pairs with different signs (S)
- Occurrence of zero values (Z)
- Maxima of absolute difference of coefficient pairs
- Maxima of relative difference of non-zero coefficient pairs with equal signs
- Parameter identifier

\begin{align*}
\text{Absdiff}(t,x) &= |i_1(t,x) - i_2(t,x)| \\
\text{Reldiff}(t,x) &= \frac{|i_1(t,x) - i_2(t,x)|}{\max(|i_1(t,x)|,|i_2(t,x)|)}
\end{align*}

\textbf{diffn} \quad \text{Compare two datasets listed by parameter name}

The same as operator \textit{diff}. Using the name instead of the identifier to label the parameter.

Parameter

\begin{tabular}{ll}
\textit{maxcount} & INTEGER & Stop after maxcount different fields \\
\textit{abslim} & FLOAT & Limit of the maximum absolute difference (default: 0) \\
\textit{rellim} & FLOAT & Limit of the maximum relative difference (default: 1) \\
\textit{names} & STRING & Consideration of the variable names of only one input file (left/right) or the intersection of both (intersect).
\end{tabular}

Example

To print the difference for each field of two datasets use:

\texttt{cdo diffn infile1 infile2}

This is an example result of two datasets with one 2D parameter over 12 timesteps:
2.1.4. NINFO - Print the number of parameters, levels or times

Synopsis

<operator> infile

Description

This module prints the number of variables, levels or times of the input dataset.

Operators

- **npar**: Number of parameters
  - Prints the number of parameters (variables).

- **nlevel**: Number of levels
  - Prints the number of levels for each variable.

- **nyear**: Number of years
  - Prints the number of different years.

- **nmon**: Number of months
  - Prints the number of different combinations of years and months.

- **ndate**: Number of dates
  - Prints the number of different dates.

- **ntime**: Number of timesteps
  - Prints the number of timesteps.

- **ngridpoints**: Number of gridpoints
  - Prints the number of gridpoints for each variable.

- **ngrids**: Number of horizontal grids
  - Prints the number of horizontal grids.

Example

To print the number of parameters (variables) in a dataset use:

```
cdo npar infile
```

To print the number of months in a dataset use:

```
cdo nmon infile
```
2.1.5. SHOWINFO - Show variables, levels or times

Synopsis

<operator> infile

Description

This module prints the format, variables, levels or times of the input dataset.

Operators

- **showformat**: Show file format
  - Prints the file format of the input dataset.
- **showcode**: Show code numbers
  - Prints the code number of all variables.
- **showname**: Show variable names
  - Prints the name of all variables.
- **showstdname**: Show standard names
  - Prints the standard name of all variables.
- **showlevel**: Show levels
  - Prints all levels for each variable.
- **showltype**: Show GRIB level types
  - Prints the GRIB level type for all z-axes.
- **showyear**: Show years
  - Prints all years.
- **showmon**: Show months
  - Prints all months.
- **showdate**: Show date information
  - Prints date information of all timesteps (format YYYY-MM-DD).
- **showtime**: Show time information
  - Prints time information of all timesteps (format hh:mm:ss).
- **showtimestamp**: Show timestamp
  - Prints timestamp of all timesteps (format YYYY-MM-DDThh:mm:ss).

Example

To print the code number of all variables in a dataset use:

```
cdo showcode infile
```

This is an example result of a dataset with three variables:

```
129 130 139
```

To print all months in a dataset use:

```
cdo showmon infile
```

This is an example result of a dataset with an annual cycle:

```
1 2 3 4 5 6 7 8 9 10 11 12
```
2.1.6. SHOWATTRIBUTE - Show attributes

Synopsis

    showattribute[,attributes]  infile

Description

This operator prints the attributes of the data variables of a dataset.
Each attribute has the following structure:

    [var_nm][att_nm]

    var_nm   Variable name (optional). Example: pressure
    att_nm   Attribute name (optional). Example: units

The value of var_nm is the name of the variable containing the attribute (named att_nm) that
you want to print. Use wildcards to print the attribute att_nm of more than one variable. A value
of var_nm of '*' will print the attribute att_nm of all data variables. If var_nm is missing then
att_nm refers to a global attribute.

The value of att_nm is the name of the attribute you want to print. Use wildcards to print more
than one attribute. A value of att_nm of '*' will print all attributes.

Parameter

    attributes      STRING      Comma-separated list of attributes.
2.1.7. FILEDES - Dataset description

Synopsis

<operator> infile

Description

This module provides operators to print meta information about a dataset. The printed meta-data depends on the chosen operator.

Operators

- **partab** Parameter table  
  Prints all available meta information of the variables.

- **codetab** Parameter code table  
  Prints a code table with a description of all variables. For each variable the operator prints one line listing the code, name, description and units.

- **griddes** Grid description  
  Prints the description of all grids.

- **zaxisdes** Z-axis description  
  Prints the description of all z-axes.

- **vct** Vertical coordinate table  
  Prints the vertical coordinate table.

Example

Assume all variables of the dataset are on a Gaussian N16 grid. To print the grid description of this dataset use:

```
cdo griddes infile
```

Result:

```
gridtype : gaussian
gridsize : 2048
xname : lon
xlongname : longitude
xunits : degrees_east
ynames : lat
ylongname : latitude
yunits : degrees_north
xsize : 64
ysize : 32
xfirst : 0
xinc : 5.625
```
2.2. File operations

This section contains modules to perform operations on files.

Here is a short overview of all operators in this section:

- **apply**: Apply operators on each input file.
- **copy**: Copy datasets
- **cat**: Concatenate datasets
- **tee**: Duplicate a data stream
- **pack**: Pack data
- **replace**: Replace variables
- **duplicate**: Duplicates a dataset
- **mergegrid**: Merge grid
- **merge**: Merge datasets with different fields
- **mergetime**: Merge datasets sorted by date and time
- **splitcode**: Split code numbers
- **splitparam**: Split parameter identifiers
- **splitname**: Split variable names
- **splitlevel**: Split levels
- **splitgrid**: Split grids
- **splitzaxis**: Split z-axes
- **splittabnum**: Split parameter table numbers
- **splithour**: Split hours
- **spleyday**: Split days
- **splitseas**: Split seasons
- **splityear**: Split years
- **splityearmon**: Split in years and months
- **splitmon**: Split months
- **splitsel**: Split time selection
- **distgrid**: Distribute horizontal grid
- **collgrid**: Collect horizontal grid
2.2.1. APPLY - Apply operators

Synopsis

   apply operators infiles

Description

The apply utility runs the named operators on each input file. The input files must be enclosed in
square brackets. This utility can only be used on a series of input files. These are all operators with
more than one input file (infiles). Here is an incomplete list of these operators: copy, cat, merge,
mergetime, select, ENSSTAT. The parameter operators is a blank-separated list of CDO operators.
Use quotation marks if more than one operator is needed. Each operator may have only one input
and output stream.

Parameter

  operators  STRING  Blank-separated list of CDO operators.

Example

Suppose we have multiple input files with multiple variables on different time steps. The input files
contain the variables U and V, among others. We are only interested in the absolute windspeed on
all time steps. Here is the standard CDO solution for this task:

   cdo expr,wind="sqrt(u*u+v*v)" -mergetime infile1 infile2 infile3 outfile

This first joins all the time steps together and then calculates the wind speed. If there are many
variables in the input files, this procedure is ineffective. In this case it is better to first calculate the
wind speed:

   cdo mergetime -expr,wind="sqrt(u*u+v*v)" infile1 \
       -expr,wind="sqrt(u*u+v*v)" infile2 \
       -expr,wind="sqrt(u*u+v*v)" infile3 outfile

However, this can quickly become very confusing with more than 3 input files. The apply operator
solves this problem:

   cdo mergetime -apply,-expr,wind="sqrt(u*u+v*v)" [ infile1 infile2 infile3 ] outfile

Another example is the calculation of the mean value over several input files with ensmean. The input
files contain several variables, but we are only interested in the variable named XXX:

   cdo ensmean -apply,-selname,XXX [ infile1 infile2 infile3 ] outfile
2.2.2. COPY - Copy datasets

Synopsis

<operator> infiles outfile

Description

This module contains operators to copy or concatenate datasets. infiles is an arbitrary number of input files. All input files need to have the same structure with the same variables on different timesteps.

Operators

- **copy**  
  Copy datasets  
  Copies all input datasets to outfile.

- **cat**  
  Concatenate datasets  
  Concatenates all input datasets and appends the result to the end of outfile. If outfile does not exist it will be created.

Example

To change the format of a dataset to NetCDF use:

```bash
cdo -f nc copy infile outfile.nc
```

Add the option `-r` to create a relative time axis, as is required for proper recognition by GrADS or Ferret:

```bash
cdo -r -f nc copy infile outfile.nc
```

To concatenate 3 datasets with different timesteps of the same variables use:

```bash
cdo copy infile1 infile2 infile3 outfile
```

If the output dataset already exists and you wish to extend it with more timesteps use:

```bash
cdo cat infile1 infile2 infile3 outfile
```
2.2.3. TEE - Duplicate a data stream and write it to file

Synopsis

\[ \text{tee,outfile2 } \text{infile outfile1} \]

Description

This operator copies the input dataset to \texttt{outfile1} and \texttt{outfile2}. The first output stream in \texttt{outfile1} can be further processed with other cdo operators. The second output \texttt{outfile2} is written to disk. It can be used to store intermediate results to a file.

Parameter

\texttt{outfile2} \hspace{1cm} \texttt{STRING} \hspace{1cm} Destination filename for the copy of the input file

Example

To compute the daily and monthly average of a dataset use:

\[ \text{cdo monavg -tee,outfile_dayavg dayavg infile outfile_monavg} \]

2.2.4. PACK - Pack data

Synopsis

\[ \text{pack } \text{infile outfile} \]

Description

Packing reduces the data volume by reducing the precision of the stored numbers. It is implemented using the NetCDF attributes \texttt{add_offset} and \texttt{scale_factor}. The operator \texttt{pack} calculates the attributes \texttt{add_offset} and \texttt{scale_factor} for all variables. The default data type for all variables is automatically changed to 16-bit integer. Use the \texttt{CDO} option -b to change the data type to a different integer precision, if needed. Missing values are automatically transformed to the current data type.
2.2.5. REPLACE - Replace variables

Synopsis

```
replace infile1 infile2 outfile
```

Description

This operator replaces variables in `infile1` by variables from `infile2` and write the result to `outfile`. Both input datasets need to have the same number of timesteps. All variable names may only occur once!

Example

Assume the first input dataset `infile1` has three variables with the names geosp, t and tslm1 and the second input dataset `infile2` has only the variable tslm1. To replace the variable tslm1 in `infile1` by `tslm1` from `infile2` use:

```
cdo replace infile1 infile2 outfile
```

2.2.6. DUPLICATE - Duplicates a dataset

Synopsis

```
duplicate[,ndup] infile outfile
```

Description

This operator duplicates the contents of `infile` and writes the result to `outfile`. The optional parameter sets the number of duplicates, the default is 2.

Parameter

```
ndup INTEGER Number of duplicates, default is 2.
```

2.2.7. MERGEGRID - Merge grid

Synopsis

```
mergegrid infile1 infile2 outfile
```

Description

Merges grid points of all variables from `infile2` to `infile1` and write the result to `outfile`. Only the non missing values of `infile2` will be used. The horizontal grid of `infile2` should be smaller or equal to the grid of `infile1` and the resolution must be the same. Only rectilinear grids are supported. Both input files need to have the same variables and the same number of timesteps.
2.2.8. MERGE - Merge datasets

Synopsis

\[ <\text{operator}> \text{ infiles outfile} \]

Description

This module reads datasets from several input files, merges them and writes the resulting dataset to outfile.

Operators

merge

Merge datasets with different fields
Merges time series of different fields from several input datasets. The number of fields per timestep written to outfile is the sum of the field numbers per timestep in all input datasets. The time series on all input datasets are required to have different fields and the same number of timesteps. The fields in each different input file either have to be different variables or different levels of the same variable. A mixture of different variables on different levels in different input files is not allowed.

mergetime

Merge datasets sorted by date and time
Merges all timesteps of all input files sorted by date and time. All input files need to have the same structure with the same variables on different timesteps. After this operation every input timestep is in outfile and all timesteps are sorted by date and time.

Environment

SKIP_SAME_TIME
If set to 1, skips all consecutive timesteps with a double entry of the same timestamp.

Note

The operators in this module need to open all input files simultaneously. The maximum number of open files depends on the operating system!

Example

Assume three datasets with the same number of timesteps and different variables in each dataset. To merge these datasets to a new dataset use:

```
cdo merge infile1 infile2 infile3 outfile
```

Assume you split a 6 hourly dataset with splithour. This produces four datasets, one for each hour. The following command merges them together:

```
cdo mergetime infile1 infile2 infile3 infile4 outfile
```
2.2.9. SPLIT - Split a dataset

Synopsis

<operator>[,params] infile obase

Description

This module splits infile into pieces. The output files will be named <obase><xxx><suffix> where suffix is the filename extension derived from the file format. xxx and the contents of the output files depend on the chosen operator. params is a comma-separated list of processing parameters.

Operators

- **splitcode**: Split code numbers
  Splits a dataset into pieces, one for each different code number. xxx will have three digits with the code number.

- **splitparam**: Split parameter identifiers
  Splits a dataset into pieces, one for each different parameter identifier. xxx will be a string with the parameter identifier.

- **splitname**: Split variable names
  Splits a dataset into pieces, one for each variable name. xxx will be a string with the variable name.

- **splitlevel**: Split levels
  Splits a dataset into pieces, one for each different level. xxx will have six digits with the level.

- **splitgrid**: Split grids
  Splits a dataset into pieces, one for each different grid. xxx will have two digits with the grid number.

- **splitzaxis**: Split z-axes
  Splits a dataset into pieces, one for each different z-axis. xxx will have two digits with the z-axis number.

- **splittabnum**: Split parameter table numbers
  Splits a dataset into pieces, one for each GRIB1 parameter table number. xxx will have three digits with the GRIB1 parameter table number.

Parameter

- **swap**: STRING
  Swap the position of obase and xxx in the output filename

- **uuid=<attname>**: STRING
  Add a UUID as global attribute <attname> to each output file

Environment

- **CDO_FILE_SUFFIX**: Set the default file suffix. This suffix will be added to the output file names instead of the filename extension derived from the file format. Set this variable to NULL to disable the adding of a file suffix.

Note

The operators in this module need to open all output files simultaneously. The maximum number of open files depends on the operating system!
Example

Assume an input GRIB1 dataset with three variables, e.g. code number 129, 130 and 139. To split this dataset into three pieces, one for each code number use:

```
cdo splitcode infile code
```

Result of `dir code*`:

```
code129.grb  code130.grb  code139.grb
```
2.2.10. SPLITTIME - Split timesteps of a dataset

Synopsis

<operator>  infile  obase

\textbf{splitmon},[\textit{format}]  infile  obase

Description

This module splits \textit{infile} into timesteps pieces. The output files will be named \textless obase\textgreater \textless xxx \textgreater <suffix> where \textit{suffix} is the filename extension derived from the file format. \textit{xxx} and the contents of the output files depends on the chosen operator.

Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{splithour}</td>
<td>Split hours</td>
</tr>
<tr>
<td>\textit{splitday}</td>
<td>Split days</td>
</tr>
<tr>
<td>\textit{splitseas}</td>
<td>Split seasons</td>
</tr>
<tr>
<td>\textit{splityear}</td>
<td>Split years</td>
</tr>
<tr>
<td>\textit{splityearmon}</td>
<td>Split in years and months</td>
</tr>
<tr>
<td>\textit{splitmon}</td>
<td>Split months</td>
</tr>
</tbody>
</table>

\textit{xxx} will have two digits with the \textit{hour}. \textit{xxx} will have two digits with the \textit{day}. \textit{xxx} will have three characters with the \textit{season}. \textit{xxx} will have four digits with the \textit{year} (YYYY).
\textit{xxx} will have six digits with the \textit{year} and \textit{month} (YYYYMM).
\textit{xxx} will have two digits with the \textit{month}.

Parameter

\textit{format}  \textbf{STRING}  \text{C-style format for strftime() (e.g. %B for the full month name)}

Environment

\textbf{CDO\_FILE\_SUFFIX}  Set the default file suffix. This suffix will be added to the output file names instead of the filename extension derived from the file format. Set this variable to NULL to disable the adding of a file suffix.

Note

The operators in this module need to open all output files simultaneously. The maximum number of open files depends on the operating system!
Example

Assume the input GRIB1 dataset has timesteps from January to December. To split each month with all variables into one separate file use:

```
cdo splitmon infile mon
```

Result of `dir mon*`:

```
mon01.grb  mon02.grb  mon03.grb  mon04.grb  mon05.grb  mon06.grb
mon07.grb  mon08.grb  mon09.grb  mon10.grb  mon11.grb  mon12.grb
```

2.2.11. SPLITSEL - Split selected timesteps

Synopsis

```
splitsel [nsets[,noffset[,nskip]]] infile obase
```

Description

This operator splits `infile` into pieces, one for each adjacent sequence $t_1,...,t_n$ of timesteps of the same selected time range. The output files will be named `<obase><nnnnnn><suffix>` where `nnnnnn` is the sequence number and `suffix` is the filename extension derived from the file format.

Parameter

- `nsets` INTEGER Number of input timesteps for each output file
- `noffset` INTEGER Number of input timesteps skipped before the first timestep range (optional)
- `nskip` INTEGER Number of input timesteps skipped between timestep ranges (optional)

Environment

- `CDO_FILE_SUFFIX` Set the default file suffix. This suffix will be added to the output file names instead of the filename extension derived from the file format. Set this variable to NULL to disable the adding of a file suffix.
2.2.12. DISTGRID - Distribute horizontal grid

Synopsis

```
distgrid, nx[,ny] infile obase
```

Description

This operator distributes a dataset into smaller pieces. Each output file contains a different region of the horizontal source grid. 2D Lon/Lat grids can be split into \( nx \times ny \) pieces, where a target grid region contains a structured longitude/latitude box of the source grid. Data on an unstructured grid is split into \( nx \) pieces. The output files will be named \(<obase><xxx><suffix>\) where suffix is the filename extension derived from the file format. \( xxx \) will have five digits with the number of the target region.

Parameter

- \( nx \) INTEGER Number of regions in x direction, or number of pieces for unstructured grids
- \( ny \) INTEGER Number of regions in y direction [default: 1]

Note

This operator needs to open all output files simultaneously. The maximum number of open files depends on the operating system!

Example

Distribute data on a 2D Lon/Lat grid into 6 smaller files, each output file receives one half of x and a third of y of the source grid:

```
cdo distgrid,2,3 infile.nc obase
```

Below is a schematic illustration of this example:

On the left side is the data of the input file and on the right side is the data of the six output files.
2.2.13. COLLGRID - Collect horizontal grid

Synopsis

\texttt{collgrid[,nx,[names]] infiles outfile}

Description

This operator collects the data of the input files to one output file. All input files need to have the same variables and the same number of timesteps on a different horizontal grid region. If the source regions are on a structured \textit{lon/lat} grid, all regions together must result in a new structured \textit{lat/long} grid box. Data on an unstructured grid is concatenated in the order of the input files. The parameter \texttt{nx} needs to be specified only for curvilinear grids.

Parameter

\begin{itemize}
  \item \texttt{nx} \hspace{1cm} \texttt{INTEGER} \hspace{1cm} Number of regions in \textit{x} direction [default: number of input files]
  \item \texttt{names} \hspace{1cm} \texttt{STRING} \hspace{1cm} Comma-separated list of variable names [default: all variables]
\end{itemize}

Note

This operator needs to open all input files simultaneously. The maximum number of open files depends on the operating system!

Example

Collect the horizontal grid of 6 input files. Each input file contains a \textit{lon/lat} region of the target grid:

\begin{verbatim}
cdo collgrid infile[1-6] outfile
\end{verbatim}

Below is a schematic illustration of this example:

On the left side is the data of the six input files and on the right side is the collected data of the output file.
2.3. Selection

This section contains modules to select time steps, fields or a part of a field from a dataset.

Here is a short overview of all operators in this section:

- `select` Select fields
- `delete` Delete fields
- `selmulti` Select multiple fields
- `delmulti` Delete multiple fields
- `changemulti` Change identification of multiple fields
- `selparam` Select parameters by identifier
- `delparam` Delete parameters by identifier
- `selcode` Select parameters by code number
- `delcode` Delete parameters by code number
- `selname` Select parameters by name
- `delname` Delete parameters by name
- `selstdname` Select parameters by standard name
- `sellevel` Select levels
- `sellevidx` Select levels by index
- `selgrid` Select grids
- `selzaxis` Select z-axes
- `selzaxisname` Select z-axes by name
- `selltype` Select GRIB level types
- `seltabnum` Select parameter table numbers
- `seltimestep` Select timesteps
- `seltime` Select times
- `selhour` Select hours
- `selday` Select days
- `selmonth` Select months
- `selyear` Select years
- `selseason` Select seasons
- `seldate` Select dates
- `selsmon` Select single month
- `sellonlatbox` Select a longitude/latitude box
- `selindexbox` Select an index box
- `selgridcell` Select grid cells
- `delgridcell` Delete grid cells
- `samplegrid` Resample grid
- `selyearidx` Select year by index
2.3.1. SELECT - Select fields

Synopsis

\(<operator>,params\) infiles outfile

Description

This module selects some fields from infiles and writes them to outfile. infiles is an arbitrary number of input files. All input files need to have the same structure with the same variables on different timesteps. The fields selected depends on the chosen parameters. Parameter is a comma-separated list of "key=value" pairs. A range of integer values can be specified by first/last[/inc]. Wildcards can be used for string values.

Operators

- select  Select fields
  Selects all fields with parameters in a user given list.
- delete  Delete fields
  Deletes all fields with parameters in a user given list.

Parameter

- name  STRING  Comma-separated list of variable names.
- param  STRING  Comma-separated list of parameter identifiers.
- code  INTEGER  Comma-separated list or first/last[/inc] range of code numbers.
- level  FLOAT  Comma-separated list of vertical levels.
- levidx  INTEGER  Comma-separated list or first/last[/inc] range of index of levels.
- zaxisname  STRING  Comma-separated list of zaxis names.
- zaxisnum  INTEGER  Comma-separated list or first/last[/inc] range of zaxis numbers.
- ltype  INTEGER  Comma-separated list or first/last[/inc] range of GRIB level types.
- gridname  STRING  Comma-separated list of grid names.
- gridnum  INTEGER  Comma-separated list or first/last[/inc] range of grid numbers.
- steptype  STRING  Comma-separated list of timestep types.
- date  STRING  Comma-separated list of dates (format YYYY-MM-DDThh:mm:ss).
- startdate  STRING  Start date (format YYYY-MM-DDThh:mm:ss).
- enddate  STRING  End date (format YYYY-MM-DDThh:mm:ss).
- minute  INTEGER  Comma-separated list or first/last[/inc] range of minutes.
- hour  INTEGER  Comma-separated list or first/last[/inc] range of hours.
- day  INTEGER  Comma-separated list or first/last[/inc] range of days.
- month  INTEGER  Comma-separated list or first/last[/inc] range of months.
- season  STRING  Comma-separated list of seasons (substring of DJFMAMJJA-SOND or ANN).
- year  INTEGER  Comma-separated list or first/last[/inc] range of years.
- dom  STRING  Comma-separated list of the day of month (e.g. 29feb).
**timestep**  INTEGER  Comma-separated list or first/last[/inc] range of timesteps. Negative values select timesteps from the end (NetCDF only).

**timestep_of_year**  INTEGER  Comma-separated list or first/last[/inc] range of timesteps of year.

**timestepmask**  STRING  Read timesteps from a mask file.

**Example**

Assume you have 3 input files. Each input file contains the same variables for a different time period. To select the variable T,U and V on the levels 200, 500 and 850 from all 3 input files, use:

```
cdo select,name=T,U,V,level=200,500,850 infile1 infile2 infile3 outfile
```

To remove the February 29th use:

```
cdo delete,dom=29feb infile outfile
```
2.3.2. SELMULTI - Select multiple fields via GRIB1 parameters

Synopsis

\[ <\text{operator}>,\text{selection-specification} \ \text{infile} \ \text{outfile} \]

Description

This module selects multiple fields from \text{infile} and writes them to \text{outfile}. \text{selection-specification} is a filename or in-place string with the selection specification. Each selection-specification has the following compact notation format:

\[ <\text{type}>(\text{parameters}; \text{leveltype}(s); \text{levels}) \]

- **type**: sel for select or del for delete (optional)
- **parameters**: GRIB1 parameter code number
- **leveltype**: GRIB1 level type
- **levels**: value of each level

Examples:

\[
(1; \ 103; \ 0) \\
(33, 34; \ 105; \ 10) \\
(11, 17; \ 105; \ 2) \\
(71, 73, 75, 61, 62, 65, 117, 67, 122, 121, 11, 131, 66, 84, 111, 112; \ 105; \ 0)
\]

The following descriptive notation can also be used for selection specification from a file:

\[ \text{SELECT/DELETE, PARAMETER} = \text{parameters}, \text{LEVTYPE} = \text{leveltype}(s), \text{LEVEL} = \text{levels} \]

Examples:

\[
\begin{align*}
\text{SELECT, PARAMETER} &= 1, \text{LEVTYPE} = 103, \text{LEVEL} = 0 \\
\text{SELECT, PARAMETER} &= 33/34, \text{LEVTYPE} = 105, \text{LEVEL} = 10 \\
\text{SELECT, PARAMETER} &= 11/17, \text{LEVTYPE} = 105, \text{LEVEL} = 2 \\
\text{SELECT, PARAMETER} &= 71/73/74/75/61/62/65/117/67/122, \text{LEVTYPE} = 105, \text{LEVEL} = 0 \\
\text{DELETE, PARAMETER} &= 128, \text{LEVTYPE} = 109, \text{LEVEL} = *
\end{align*}
\]

The following will convert Pressure from Pa into hPa; Temp from Kelvin to Celsius:

\[
\begin{align*}
\text{SELECT, PARAMETER} &= 1, \text{LEVTYPE} = 103, \text{LEVEL} = 0, \text{SCALE} = 0.01 \\
\text{SELECT, PARAMETER} &= 11, \text{LEVTYPE} = 105, \text{LEVEL} = 2, \text{OFFSET} = 273.15
\end{align*}
\]

If \text{SCALE} and/or \text{OFFSET} are defined, then the data values are scaled as \text{SCALE}*(\text{VALUE}-\text{OFFSET}).

Operators

- **selmulti**: Select multiple fields
- **delmulti**: Delete multiple fields
- **changemulti**: Change identification of multiple fields

Example

Change ECMWF GRIB code of surface pressure to Hirlam notation:

\[
\text{cdo changemulti,'\{(134;1;*|1;105;*)\}'} \ \text{infile} \ \text{outfile}
\]
2.3.3. SELVAR - Select fields

Synopsis

<operator>,params infile outfile
selcode,codes infile outfile
delcode,codes infile outfile
selname,names infile outfile
delname,names infile outfile
selstdname,stdnames infile outfile
sellevel,levels infile outfile
sellevidx,levidx infile outfile
selgrid,grids infile outfile
selzaxis,zaxes infile outfile
selzaxisname,zaxisnames infile outfile
seltype,ltypes infile outfile
seltabnum,tabnums infile outfile

Description

This module selects some fields from infile and writes them to outfile. The fields selected depends on the chosen operator and the parameters. A range of integer values can be specified by first/last[/inc].

Operators

selparam Select parameters by identifier
Selects all fields with parameter identifiers in a user given list.
delparam Delete parameters by identifier
Deletes all fields with parameter identifiers in a user given list.
select Select parameters by code number
Selects all fields with code numbers in a user given list or range.
delcode Delete parameters by code number
Deletes all fields with code numbers in a user given list or range.

selname Select parameters by name
Selects all fields with parameter names in a user given list.
delname Delete parameters by name
Deletes all fields with parameter names in a user given list.

selstdname Select parameters by standard name
Selects all fields with standard names in a user given list.
sellevel Select levels
Selects all fields with levels in a user given list.
sellevidx Select levels by index
Selects all fields with index of levels in a user given list or range.
selgrid Select grids
Selects all fields with grids in a user given list.
**Parameters**

- **params** STRING  
  Comma-separated list of parameter identifiers.

- **codes** INTEGER  
  Comma-separated list or first/last/[inc] range of code numbers.

- **names** STRING  
  Comma-separated list of variable names.

- **stdnames** STRING 
  Comma-separated list of standard names.

- **levels** FLOAT  
  Comma-separated list of vertical levels.

- **levidx** INTEGER  
  Comma-separated list or first/last/[inc] range of index of levels.

- **ltypes** INTEGER  
  Comma-separated list or first/last/[inc] range of GRIB level types.

- **grids** STRING  
  Comma-separated list of grid names or numbers.

- **zaxes** STRING  
  Comma-separated list of z-axis types or numbers.

- **zaxisnames** STRING  
  Comma-separated list of z-axis names.

- **tabnums** INTEGER  
  Comma-separated list or range of parameter table numbers.

**Example**

Assume an input dataset has three variables with the code numbers 129, 130 and 139. To select the variables with the code number 129 and 139 use:

```
cdo selcode,129,139 infile outfile
```

You can also select the code number 129 and 139 by deleting the code number 130 with:

```
cdo delcode,130 infile outfile
```
2.3.4. SELTIME - Select timesteps

Synopsis

```
  seltimestep,timesteps  infile outfile
  seltimes,time       infile outfile
  selhour,hours       infile outfile
  seday,days          infile outfile
  selmonth,months     infile outfile
  selyear,years       infile outfile
  selseason,seasons   infile outfile
  seldate,startdate[,enddate]  infile outfile
  selsmon,month[,nts1[,nts2]]  infile outfile
```

Description

This module selects user specified timesteps from infile and writes them to outfile. The timesteps selected depends on the chosen operator and the parameters. A range of integer values can be specified by first/last[/inc].

Operators

```
  seltimestep  Select timesteps
               Selects all timesteps with a timestep in a user given list or range.
  seltimes     Select times
               Selects all timesteps with a time in a user given list or range.
  selhour      Select hours
               Selects all timesteps with a hour in a user given list or range.
  seday        Select days
               Selects all timesteps with a day in a user given list or range.
  selmonth     Select months
               Selects all timesteps with a month in a user given list or range.
  selyear      Select years
               Selects all timesteps with a year in a user given list or range.
  selseason    Select seasons
               Selects all timesteps with a month of a season in a user given list.
  seldate      Select dates
               Selects all timesteps with a date in a user given range.
  selsmon      Select single month
               Selects a month and optional an arbitrary number of timesteps before and after this month.
```
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timesteps</td>
<td>INTEGER</td>
<td>Comma-separated list or first/last[/inc] range of timesteps. Negative values select timesteps from the end (NetCDF only).</td>
</tr>
<tr>
<td>times</td>
<td>STRING</td>
<td>Comma-separated list of times (format hh:mm:ss).</td>
</tr>
<tr>
<td>hours</td>
<td>INTEGER</td>
<td>Comma-separated list or first/last[/inc] range of hours.</td>
</tr>
<tr>
<td>days</td>
<td>INTEGER</td>
<td>Comma-separated list or first/last[/inc] range of days.</td>
</tr>
<tr>
<td>months</td>
<td>INTEGER</td>
<td>Comma-separated list or first/last[/inc] range of months.</td>
</tr>

<tr>
<td>nts2</td>
<td>INTEGER</td>
<td>Number of timesteps after the selected month [default: nts1].</td>
</tr>
</tbody>
</table>
2.3.5. SELBOX - Select a box of a field

Synopsis

sellonlatbox,lon1,lon2,lat1,lon2 infile outfile
sellindexbox,idx1,idx2,idy1,idx2 outfile

Description

Selects a box of the rectangularly understood field.

Operators

sellonlatbox  Select a longitude/latitude box
Selects a regular longitude/latitude box. The user has to give the longitudes and
latitudes of the edges of the box. Considered are only those grid cells with the grid
center inside the lon/lat box. For rotated lon/lat grids the parameter needs to be
rotated coordinates.

selindexbox  Select an index box
Selects an index box. The user has to give the indexes of the edges of the box. The
index of the left edge may be greater than that of the right edge.

Parameter

lon1  FLOAT  Western longitude in degrees
lon2  FLOAT  Eastern longitude in degrees
lat1  FLOAT  Southern or northern latitude in degrees
lat2  FLOAT  Northern or southern latitude in degrees
idx1  INTEGER  Index of first longitude (1 - nlon)
idx2  INTEGER  Index of last longitude (1 - nlon)
idy1  INTEGER  Index of first latitude (1 - nlat)
idy2  INTEGER  Index of last latitude (1 - nlat)

Example

To select the region with the longitudes from 30W to 60E and latitudes from 30N to 80N from all
input fields use:

\[ \text{cd\ o sellonlatbox,} -30,60,30,80 \text{ infile outfile} \]

If the input dataset has fields on a Gaussian N16 grid, the same box can be selected with selindexbox
by:

\[ \text{cd\ o selindexbox,60,11,3,11 infile outfile} \]
2.3.6. SELGRIDCELL - Select grid cells

Synopsis

<operator>,indexes infile outfile

Description

Selects grid cells of all fields from infile. The user has to give the indexes of each grid cell. The resulting grid in outfile is unstructured.

Operators

- selgridcell Select grid cells
- delgridcell Delete grid cells

Parameter

indexes INTEGER Comma-separated list or first/last[/inc] range of indexes

2.3.7. SAMPLEGRID - Resample grid

Synopsis

samplegrid.factor infile outfile

Description

This is a special operator for resampling the horizontal grid. No interpolation takes place. Resample factor=2 means every second grid point is removed. Only rectilinear and curvilinear source grids are supported by this operator.

Parameter

factor INTEGER Resample factor, typically 2, which will half the resolution

2.3.8. SELYEARIDX - Select year by index

Synopsis

selyearidx infile1 infile2 outfile

Description

Selects field elements from infile2 by a yearly time index from infile1. The yearly indices in infile1 should be the result of corresponding yearminidx and yearmaxidx operations, respectively.
2.4. Conditional selection

This section contains modules to conditional select field elements. The fields in the first input file are handled as a mask. A value not equal to zero is treated as 'true', zero is treated as 'false'.

Here is a short overview of all operators in this section:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifthen</td>
<td>If then</td>
</tr>
<tr>
<td>ifnotthen</td>
<td>If not then</td>
</tr>
<tr>
<td>ifthenelse</td>
<td>If then else</td>
</tr>
<tr>
<td>ifthenc</td>
<td>If then constant</td>
</tr>
<tr>
<td>ifnotthenc</td>
<td>If not then constant</td>
</tr>
<tr>
<td>reducegrid</td>
<td>Reduce input file variables to locations, where mask is non-zero.</td>
</tr>
</tbody>
</table>
2.4.1. COND - Conditional select one field

Synopsis

<operator> infile1 infile2 outfile

Description

This module selects field elements from infile2 with respect to infile1 and writes them to outfile. The fields in infile1 are handled as a mask. A value not equal to zero is treated as 'true', zero is treated as 'false'. The number of fields in infile1 has either to be the same as in infile2 or the same as in one timestep of infile2 or only one. The fields in outfile inherit the meta data from infile2.

Operators

ifthen

\[ o(t,x) = \begin{cases} 
  i_2(t,x) & \text{if } i_1([t,x]) \neq 0 \land i_1([t,x]) \neq \text{miss} \\
  \text{miss} & \text{if } i_1([t,x]) = 0 \lor i_1([t,x]) = \text{miss} 
\end{cases} \]

ifnotthen

\[ o(t,x) = \begin{cases} 
  i_2(t,x) & \text{if } i_1([t,x]) = 0 \land i_1([t,x]) \neq \text{miss} \\
  \text{miss} & \text{if } i_1([t,x]) \neq 0 \lor i_1([t,x]) = \text{miss} 
\end{cases} \]

Example

To select all field elements of infile2 if the corresponding field element of infile1 is greater than 0 use:

cdo ifthen infile1 infile2 outfile

2.4.2. COND2 - Conditional select two fields

Synopsis

ifthenelse infile1 infile2 infile3 outfile

Description

This operator selects field elements from infile2 or infile3 with respect to infile1 and writes them to outfile. The fields in infile1 are handled as a mask. A value not equal to zero is treated as 'true', zero is treated as 'false'. The number of fields in infile1 has either to be the same as in infile2 or the same as in one timestep of infile2 or only one. infile2 and infile3 need to have the same number of fields. The fields in outfile inherit the meta data from infile2.

\[ o(t,x) = \begin{cases} 
  i_2(t,x) & \text{if } i_1([t,x]) \neq 0 \land i_1([t,x]) \neq \text{miss} \\
  i_3(t,x) & \text{if } i_1([t,x]) = 0 \land i_1([t,x]) \neq \text{miss} \\
  \text{miss} & \text{if } i_1([t,x]) = \text{miss} 
\end{cases} \]

Example

To select all field elements of infile2 if the corresponding field element of infile1 is greater than 0 and from infile3 otherwise use:

cdo ifthenelse infile1 infile2 infile3 outfile
2.4.3. CONDC - Conditional select a constant

Synopsis

\[ \langle \text{operator} \rangle, c \text{ infile outfile} \]

Description

This module creates fields with a constant value or missing value. The fields in infile are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifthenc</td>
<td>If then constant</td>
</tr>
</tbody>
</table>
|               | \[ o(t, x) = \begin{cases} \begin{array}{ll} c & \text{if } i(t, x) \neq 0 \land i(t, x) \neq \text{miss} \\ \\
|               | & \text{miss if } i(t, x) = 0 \lor i(t, x) = \text{miss} \end{array} \end{cases} \] |
| ifnotthenc    | If not then constant         |
|               | \[ o(t, x) = \begin{cases} \begin{array}{ll} c & \text{if } i(t, x) = 0 \land i(t, x) \neq \text{miss} \\ \\
|               | & \text{miss if } i(t, x) \neq 0 \lor i(t, x) = \text{miss} \end{array} \end{cases} \] |

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>FLOAT</td>
<td>Constant</td>
</tr>
</tbody>
</table>

Example

To create fields with the constant value 7 if the corresponding field element of infile is greater than 0 use:

\[ \text{cdo ifthenc,7 infile outfile} \]
2.4.4. MAPREDUCE - Reduce fields to user-defined mask

Synopsis

\texttt{reducegrid, mask[,limitCoordsOutput]} infile outfile

Description

This module holds an operator for data reduction based on a user defined mask. The output grid is unstructured and includes coordinate bounds. Bounds can be avoided by using the additional 'nobounds' keyword. With 'nocoords' given, coordinates a completely suppressed.

Parameter

- \texttt{mask} STRING file which holds the mask field
- \texttt{limitCoordsOutput} STRING optional parameter to limit coordinates output: 'nobounds' disables coordinate bounds, 'nocoords' avoids all coordinate information

Example

To limit data fields to land values, a mask has to be created first with

\begin{verbatim}
cdo -gtc,0 -topo,ni96 lsm_gme96.grb
\end{verbatim}

Here a GME grid is used. Say temp_gme96.grb contains a global temperture field. The following command limits the global grid to landpoints.

\begin{verbatim}
cdo -f nc reduce,lsm_gme96.grb temp_gme96.grb tempOnLand_gme96.nc
\end{verbatim}

Note that output file type is NetCDF, because unstructured grids cannot be stored in GRIB format.
2.5. **Comparison**

This section contains modules to compare datasets. The resulting field is a mask containing 1 if the comparison is true and 0 if not.

Here is a short overview of all operators in this section:

<table>

</tr>
</tbody>
</table>
2.5.1. COMP - Comparison of two fields

Synopsis

<operator> infile1 infile2 outfile

Description

This module compares two datasets field by field. The resulting field is a mask containing 1 if the comparison is true and 0 if not. The number of fields in infile1 should be the same as in infile2. One of the input files can contain only one timestep or one field. The fields in outfile inherit the meta data from infile1 or infile2. The type of comparison depends on the chosen operator.

Operators

\[
\begin{align*}
\text{eq} & \quad \text{Equal} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) = i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) \neq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\text{ne} & \quad \text{Not equal} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) \neq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) = i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\text{le} & \quad \text{Less equal} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) \leq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) > i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\text{lt} & \quad \text{Less than} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) < i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) \geq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\text{ge} & \quad \text{Greater equal} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) \geq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) < i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\text{gt} & \quad \text{Greater than} \\
\text{o}(t,x) &= \begin{cases} 
1 & \text{if } i_1(t,x) > i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
0 & \text{if } i_1(t,x) \leq i_2(t,x) \land i_1(t,x),i_2(t,x) \neq \text{miss} \\
\text{miss} & \text{if } i_1(t,x) = \text{miss} \lor i_2(t,x) = \text{miss}
\end{cases}
\end{align*}
\]

Example

To create a mask containing 1 if the elements of two fields are the same and 0 if the elements are different use:

\[
cdo \text{eq} \text{infile1} \text{infile2 outfile}
\]
2.5.2. COMPC - Comparison of a field with a constant

Synopsis

<operator>,c infile outfile

Description

This module compares all fields of a dataset with a constant. The resulting field is a mask containing 1 if the comparison is true and 0 if not. The type of comparison depends on the chosen operator.

Operators

**eqc** Equal constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) = c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) \neq c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

**nec** Not equal constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) \neq c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) = c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

**lec** Less equal constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) \leq c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) > c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

**ltc** Less than constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) < c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) \geq c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

**gec** Greater equal constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) \geq c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) < c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

**gtc** Greater than constant

\[
o(t, x) = \begin{cases} 
1 & \text{if } i(t, x) > c \land i(t, x), c \neq \text{miss} \\
0 & \text{if } i(t, x) \leq c \land i(t, x), c \neq \text{miss} \\
\text{miss} & \text{if } i(t, x) = \text{miss} \lor c = \text{miss}
\end{cases}
\]

Parameter

\[c\] FLOAT Constant

Example

To create a mask containing 1 if the field element is greater than 273.15 and 0 if not use:

\[\text{cdo gtc,273.15 infile outfile}\]
2.6. Modification

This section contains modules to modify the metadata, fields or part of a field in a dataset.

Here is a short overview of all operators in this section:

</tbody>
</table>
2.6.1. SETATTRIBUTE - Set attributes

Synopsis

setattribute,attributes infile outfile

Description

This operator sets attributes of a dataset and writes the result to outfile. The new attributes are only available in outfile if the file format supports attributes.

Each attribute has the following structure:

[var_nm][@att_nm]=[att_val]

- var_nm  Variable name (optional). Example: pressure
- att_nm  Attribute name. Example: units
- att_val  Comma-separated list of attribute values. Example: pascal

The value of var_nm is the name of the variable containing the attribute (named att_nm) that you want to set. Use wildcards to set the attribute att_nm to more than one variable. A value of var_nm of '*' will set the attribute att_nm to all data variables. If var_nm is missing then att_nm refers to a global attribute.

The value of att_nm is the name of the attribute you want to set.

The value of att_val is the contents of the attribute att_nm. att_val may be a single value or one-dimensional array of elements. The type and the number of elements of an attribute will be detected automatically from the contents of the values. An already existing attribute att_nm will be overwritten or it will be removed if att_val is omitted.

A special meaning has the attribute name FILE. If this is the 1st attribute then all attributes are read from a file specified in the value of att_val.

Parameter

- attributes  STRING  Comma-separated list of attributes.

Note

Attributes are evaluated by CDO when opening infile. Therefore the result of this operator is not available for other operators when this operator is used in chaining operators.

Example

To set the units of the variable pressure to pascal use:

```cdo setattribute,pressure@units=pascal infile outfile```

To set the global text attribute 'my_att' to 'my contents', use:

```cdo setattribute,my_att="my contents" infile outfile```

Result of 'ncdump -h outfile':
netcdf outfile {
  dimensions: ...
  variables: ...
  // global attributes:
  :my_att = 'my contents' ;
}
2.6.2. SETPARTAB - Set parameter table

Synopsis

<operator>,table[,convert]  infile  outfile

Description

This module transforms data and metadata of infile via a parameter table and writes the result to outfile. A parameter table is an ASCII formatted file with a set of parameter entries for each variable. Each new set have to start with "&parameter" and to end with "/".

The following parameter table entries are supported:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>WORD</td>
<td>Name of the variable</td>
</tr>
<tr>
<td>out_name</td>
<td>WORD</td>
<td>New name of the variable</td>
</tr>
<tr>
<td>param</td>
<td>WORD</td>
<td>Parameter identifier (GRIB1: code[,tabnum]; GRIB2: num[,cat[,dis]])</td>
</tr>
<tr>
<td>out_param</td>
<td>WORD</td>
<td>New parameter identifier</td>
</tr>
<tr>
<td>type</td>
<td>WORD</td>
<td>Data type (real or double)</td>
</tr>
<tr>
<td>standard_name</td>
<td>WORD</td>
<td>As defined in the CF standard name table</td>
</tr>
<tr>
<td>long_name</td>
<td>STRING</td>
<td>Describing the variable</td>
</tr>
<tr>
<td>units</td>
<td>STRING</td>
<td>Specifying the units for the variable</td>
</tr>
<tr>
<td>comment</td>
<td>STRING</td>
<td>Information concerning the variable</td>
</tr>
<tr>
<td>cell_methods</td>
<td>STRING</td>
<td>Information concerning calculation of means or climatologies</td>
</tr>
<tr>
<td>cell_measures</td>
<td>STRING</td>
<td>Indicates the names of the variables containing cell areas and volumes</td>
</tr>
<tr>
<td>missing_value</td>
<td>FLOAT</td>
<td>Specifying how missing data will be identified</td>
</tr>
<tr>
<td>valid_min</td>
<td>FLOAT</td>
<td>Minimum valid value</td>
</tr>
<tr>
<td>valid_max</td>
<td>FLOAT</td>
<td>Maximum valid value</td>
</tr>
<tr>
<td>ok_min_mean_abs</td>
<td>FLOAT</td>
<td>Minimum absolute mean</td>
</tr>
<tr>
<td>ok_max_mean_abs</td>
<td>FLOAT</td>
<td>Maximum absolute mean</td>
</tr>
<tr>
<td>factor</td>
<td>FLOAT</td>
<td>Scale factor</td>
</tr>
<tr>
<td>delete</td>
<td>INTEGER</td>
<td>Set to 1 to delete variable</td>
</tr>
<tr>
<td>convert</td>
<td>INTEGER</td>
<td>Set to 1 to convert the unit if necessary</td>
</tr>
</tbody>
</table>

Unsupported parameter table entries are stored as variable attributes. The search key for the variable depends on the operator. Use setpartabn to search variables by the name. This is typically used for NetCDF datasets. The operator setpartabp searches variables by the parameter ID.

Operators

setpartabp  Set parameter table
Search variables by the parameter identifier.

setpartabn  Set parameter table
Search variables by name.

Parameter

table  STRING  Parameter table file or name
convert  STRING  Converts the units if necessary
Example

Here is an example of a parameter table for one variable:

```
prompt> cat mypartab
&parameter
  name = t
  out_name = ta
  standard_name = air_temperature
  units = "K"
  missing_value = 1.0e+20
  valid_min = 157.1
  valid_max = 336.3
/
```

To apply this parameter table to a dataset use:

```
cdo setpartabn,mypartab,convert infile outfile
```

This command renames the variable t to ta. The standard name of this variable is set to `air_temperature` and the unit is set to `[K]` (converts the unit if necessary). The missing value will be set to `1.0e+20`. In addition it will be checked whether the values of the variable are in the range of `157.1` to `336.3`. 
### 2.6.3. SET - Set field info

**Synopsis**

- `setcodetab,table` infile outfile
- `setcode,code` infile outfile
- `setparam,param` infile outfile
- `setname,name` infile outfile
- `setunit,unit` infile outfile
- `setlevel,level` infile outfile
- `setltype,ltype` infile outfile

**Description**

This module sets some field information. Depending on the chosen operator the parameter table, code number, parameter identifier, variable name or level is set.

**Operators**

- `setcodetab` Set parameter code table
  Sets the parameter code table for all variables.
- `setcode` Set code number
  Sets the code number for all variables to the same given value.
- `setparam` Set parameter identifier
  Sets the parameter identifier of the first variable.
- `setname` Set variable name
  Sets the name of the first variable.
- `setunit` Set variable unit
  Sets the unit of the first variable.
- `setlevel` Set level
  Sets the first level of all variables.
- `setltype` Set GRIB level type
  Sets the GRIB level type of all variables.

**Parameter**

- `table` STRING Parameter table file or name
- `code` INTEGER Code number
- `param` STRING Parameter identifier (GRIB1: code[.tabnum]; GRIB2: num[.cat[.dis]])
- `name` STRING Variable name
- `level` FLOAT New level
- `ltype` INTEGER GRIB level type
2.6.4. SETTIME - Set time

Synopsis

```
setdate, date  infile outfile
settime, time  infile outfile
setday, day    infile outfile
setmon, month  infile outfile
setyear, year  infile outfile
settunits, units infile outfile
settaxis, date,time[,inc]  infile outfile
settbounds, frequency  infile outfile
setreftime, date,time[,units]  infile outfile
setcalendar, calendar  infile outfile
shifttime, sval  infile outfile
```

Description

This module sets the time axis or part of the time axis. Which part of the time axis is overwritten/created depends on the chosen operator.

Operators

- **setdate** Set date
  Sets the date in every timestep to the same given value.

- **settime** Set time of the day
  Sets the time in every timestep to the same given value.

- **setday** Set day
  Sets the day in every timestep to the same given value.

- **setmon** Set month
  Sets the month in every timestep to the same given value.

- **setyear** Set year
  Sets the year in every timestep to the same given value.

- **settunits** Set time units
  Sets the base units of a relative time axis.

- **settaxis** Set time axis
  Sets the time axis.

- **settbounds** Set time bounds
  Sets the time bounds.

- **setreftime** Set reference time
  Sets the reference time of a relative time axis.

- **setcalendar** Set calendar
  Sets the calendar of a relative time axis.

- **shifttime** Shift timesteps
  Shifts all timesteps by the parameter sval.
Parameter

day INTEGER Value of the new day
month INTEGER Value of the new month
year INTEGER Value of the new year
units STRING Base units of the time axis (seconds, minutes, hours, days, months, years)
date STRING Date (format: YYYY-MM-DD)
time STRING Time (format: hh:mm:ss)
inc STRING Optional increment (seconds, minutes, hours, days, months, years) [default: 1hour]
frequency STRING Frequency of the time series (hour, day, month, year)
calendar STRING Calendar (standard, proleptic_gregorian, 360_day, 365_day, 366_day)
sval STRING Shift value (e.g. -3hour)

Example

To set the time axis to 1987-01-16 12:00:00 with an increment of one month for each timestep use:

```
cdo settaxis,1987-01-16,12:00:00,1mon infile outfile
```

Result of `cdo showdate outfile` for a dataset with 12 timesteps:

```
```

To shift this time axis by -15 days use:

```
cdo shifttime,-15days infile outfile
```

Result of `cdo showdate outfile`:

```
```
2.6.5. CHANGE - Change field header

Synopsis

chcode,oldcode,newcode[,...]  infile outfile
chparam,oldparam,newparam,...  infile outfile
chname,oldname,newname,...  infile outfile
chunit,oldunit,newunit,...  infile outfile
chlevel,oldlev,newlev,...  infile outfile
chlevelc,code,oldlev,newlev  infile outfile
chlevelv,name,oldlev,newlev  infile outfile

Description

This module reads fields from infile, changes some header values and writes the results to outfile. The kind of changes depends on the chosen operator.

Operators

chcode    Change code number
          Changes some user given code numbers to new user given values.

chparam   Change parameter identifier
          Changes some user given parameter identifiers to new user given values.

chname    Change variable or coordinate name
          Changes some user given variable or coordinate names to new user given names.

chunit    Change variable unit
          Changes some user given variable units to new user given units.

chlevel   Change level
          Changes some user given levels to new user given values.

chlevelc  Change level of one code
          Changes one level of a user given code number.

chlevelv  Change level of one variable
          Changes one level of a user given variable name.

Parameter

code      INTEGER   Code number
oldcode,newcode,... INTEGER   Pairs of old and new code numbers
oldparam,newparam,... STRING  Pairs of old and new parameter identifiers
name      STRING    Variable name
oldname,newname,... STRING   Pairs of old and new variable names
oldlev    FLOAT     Old level
newlev    FLOAT     New level
oldlev,newlev,... FLOAT   Pairs of old and new levels

Example

To change the code number 98 to 179 and 99 to 211 use:

    cdo chcode,98,179,99,211 infile outfile
2.6.6. SETGRID - Set grid information

Synopsis

setgrid, grid infile outfile
setgridtype, gridtype infile outfile
setgridarea, gridarea infile outfile
setgridmask, gridmask infile outfile

Description

This module modifies the metadata of the horizontal grid. Depending on the chosen operator a new grid description is set, the coordinates are converted or the grid cell area is added.

Operators

setgrid Set grid
Sets a new grid description. The input fields need to have the same grid size as the size of the target grid description.

setgridtype Set grid type
Sets the grid type of all input fields. The following grid types are available:

- curvilinear: Converts a regular grid to a curvilinear grid
- unstructured: Converts a regular or curvilinear grid to an unstructured grid
- dereference: Dereference a reference to a grid
- regular: Linear interpolation of a reduced Gaussian grid to a regular Gaussian grid
- regularnn: Nearest neighbor interpolation of a reduced Gaussian grid to a regular Gaussian grid
- lonlat: Converts a regular lonlat grid stored as a curvilinear grid back to a lonlat grid

setgridarea Set grid cell area
Sets the grid cell area. The parameter gridarea is the path to a data file, the first field is used as grid cell area. The input fields need to have the same grid size as the grid cell area. The grid cell area is used to compute the weights of each grid cell if needed by an operator, e.g. for fldmean.

setgridmask Set grid mask
Sets the grid mask. The parameter gridmask is the path to a data file, the first field is used as the grid mask. The input fields need to have the same grid size as the grid mask. The grid mask is used as the target grid mask for remapping, e.g. for remapbil.

Parameter

grid STRING Grid description file or name
gridtype STRING Grid type (curvilinear, unstructured, regular, lonlat or dereference)
gridarea STRING Data file, the first field is used as grid cell area
gridmask STRING Data file, the first field is used as grid mask
Example

Assuming a dataset has fields on a grid with 2048 elements without or with wrong grid description. To set the grid description of all input fields to a Gaussian N32 grid (8192 gridpoints) use:

```
cdo setgrid,n32 infile outfile
```

2.6.7. SETZAXIS - Set z-axis information

Synopsis

```
setzaxis,zaxis infile outfile
genlevelbounds[,zbot[,ztop]] infile outfile
```

Description

This module modifies the metadata of the vertical grid.

Operators

- **setzaxis**
  - Set z-axis
  - This operator sets the z-axis description of all variables with the same number of level as the new z-axis.

- **genlevelbounds**
  - Generate level bounds
  - Generates the layer bounds of the z-axis.

Parameter

- **zaxis** STRING
  - Z-axis description file or name of the target z-axis

- **zbot** FLOAT
  - Specifying the bottom of the vertical column. Must have the same units as z-axis.

- **ztop** FLOAT
  - Specifying the top of the vertical column. Must have the same units as z-axis.
2.6.8. INVERT - Invert latitudes

Synopsis

invertlat infield outfile

Description

This operator inverts the latitudes of all fields on a rectilinear grid.

Example

To invert the latitudes of a 2D field from N->S to S->N use:

```bash
cdo invertlat infield outfile
```

2.6.9. INVERTLEV - Invert levels

Synopsis

invertlev infield outfile

Description

This operator inverts the levels of all 3D variables.
2.6.10. SHIFTXY - Shift field

Synopsis

\(<\text{operator}>,<\text{nshift}>,<\text{cyclic}>,<\text{coord}>\) infile outfile

Description

This module contains operators to shift all fields in x or y direction. All fields need to have the same
horizontal rectilinear or curvilinear grid.

Operators

- `shiftx` Shift x
  Shifts all fields in x direction.
- `shifty` Shift y
  Shifts all fields in y direction.

Parameter

- `nshift` INTEGER Number of grid cells to shift (default: 1)
- `cyclic` STRING If set, cells are filled up cyclic (default: missing value)
- `coord` STRING If set, coordinates are also shifted

Example

To shift all input fields in the x direction by +1 cells and fill the new cells with missing value, use:

```
cdo shiftx infile outfile
```

To shift all input fields in the x direction by +1 cells and fill the new cells cyclic, use:

```
cdo shiftx,1,cyclic infile outfile
```
2.6.11. MASKREGION - Mask regions

Synopsis

```
maskregion,regions  infile  outfile
```

Description

Masks different regions of fields with a regular lon/lat grid. The elements inside a region are untouched, the elements outside are set to missing value. Considered are only those grid cells with the grid center inside the regions. All input fields must have the same horizontal grid. The user has to give ASCII formatted files with different regions. A region is defined by a polygon. Each line of a polygon description file contains the longitude and latitude of one point. Each polygon description file can contain one or more polygons separated by a line with the character &.

Parameter

```
regions   STRING   Comma-separated list of ASCII formatted files with different regions
```

Example

To mask the region with the longitudes from 120E to 90W and latitudes from 20N to 20S on all input fields use:

```
cdo maskregion,myregion infile outfile
```

For this example the polygon description file `myregion` should contain the following four coordinates:

```
120  20
120  20
270 -20
270  20
```
2.6.12. MASKBOX - Mask a box

Synopsis

\[
\text{masklonlatbox}, \text{lon1}, \text{lon2}, \text{lat1}, \text{lat2} \quad \text{infile} \quad \text{outfile} \\
\text{maskindexbox}, \text{idx1}, \text{idx2}, \text{idy1}, \text{idy2} \quad \text{infile} \quad \text{outfile}
\]

Description

Masked a box of the rectangularly understood field. The elements inside the box are untouched, the elements outside are set to missing value. All input fields need to have the same horizontal grid. Use \text{sellonlatbox} or \text{sellindexbox} if only the data inside the box are needed.

Operators

\text{masklonlatbox} \quad \text{Mask a longitude/latitude box}

Masked a regular longitude/latitude box. The user has to give the longitudes and latitudes of the edges of the box. Considered are only those grid cells with the grid center inside the lon/lat box.

\text{maskindexbox} \quad \text{Mask an index box}

Masked an index box. The user has to give the indexes of the edges of the box. The index of the left edge can be greater than the one of the right edge.

Parameter

- \text{lon1} \quad \text{FLOAT} \quad \text{Western longitude}
- \text{lon2} \quad \text{FLOAT} \quad \text{Eastern longitude}
- \text{lat1} \quad \text{FLOAT} \quad \text{Southern or northern latitude}
- \text{lat2} \quad \text{FLOAT} \quad \text{Northern or southern latitude}
- \text{idx1} \quad \text{INTEGER} \quad \text{Index of first longitude}
- \text{idx2} \quad \text{INTEGER} \quad \text{Index of last longitude}
- \text{idy1} \quad \text{INTEGER} \quad \text{Index of first latitude}
- \text{idy2} \quad \text{INTEGER} \quad \text{Index of last latitude}

Example

To mask the region with the longitudes from 120E to 90W and latitudes from 20N to 20S on all input fields use:

\[
\text{cdo masklonlatbox,120,-90,20,-20} \quad \text{infile} \quad \text{outfile}
\]

If the input dataset has fields on a Gaussian N16 grid, the same box can be masked with \text{maskindexbox} by:

\[
\text{cdo maskindexbox,23,48,13,20} \quad \text{infile} \quad \text{outfile}
\]
2.6.13. SETBOX - Set a box to constant

Synopsis

setclonlatbox,c,lon1,lon2,lat1,lat2 infile outfile
setcindexbox,c,idx1,idx2,idx1,idx2 infile outfile

Description

Sets a box of the rectangularly understood field to a constant value. The elements outside the box are untouched, the elements inside are set to the given constant. All input fields need to have the same horizontal grid.

Operators

setclonlatbox Set a longitude/latitude box to constant
Sets the values of a longitude/latitude box to a constant value. The user has to give the longitudes and latitudes of the edges of the box.

setcindexbox Set an index box to constant
Sets the values of an index box to a constant value. The user has to give the indexes of the edges of the box. The index of the left edge can be greater than the one of the right edge.

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>FLOAT</td>
<td>Constant</td>
</tr>
<tr>
<td>lon1</td>
<td>FLOAT</td>
<td>Western longitude</td>
</tr>
<tr>
<td>lon2</td>
<td>FLOAT</td>
<td>Eastern longitude</td>
</tr>
<tr>
<td>lat1</td>
<td>FLOAT</td>
<td>Southern or northern latitude</td>
</tr>
<tr>
<td>lat2</td>
<td>FLOAT</td>
<td>Northern or southern latitude</td>
</tr>
<tr>
<td>idx1</td>
<td>INTEGER</td>
<td>Index of first longitude</td>
</tr>
<tr>
<td>idx2</td>
<td>INTEGER</td>
<td>Index of last longitude</td>
</tr>
<tr>
<td>idy1</td>
<td>INTEGER</td>
<td>Index of first latitude</td>
</tr>
<tr>
<td>idy2</td>
<td>INTEGER</td>
<td>Index of last latitude</td>
</tr>
</tbody>
</table>

Example

To set all values in the region with the longitudes from 120E to 90W and latitudes from 20N to 20S to the constant value -1.23 use:

```
cdo setclonlatbox,-1.23,120,-90,20,-20 infile outfile
```

If the input dataset has fields on a Gaussian N16 grid, the same box can be set with setcindexbox by:

```
cdo setcindexbox,-1.23,23,48,13,20 infile outfile
```
2.6.14. ENLARGE - Enlarge fields

Synopsis

```
enlarge grid infile outfile
```

Description

Enlarge all fields of `infile` to a user given horizontal grid. Normally only the last field element is used for the enlargement. If however the input and output grid are regular lon/lat grids, a zonal or meridional enlargement is possible. Zonal enlargement takes place, if the xsize of the input field is 1 and the ysize of both grids are the same. For meridional enlargement the ysize have to be 1 and the xsize of both grids should have the same size.

Parameter

```
grid   STRING   Target grid description file or name
```

Example

Assumed you want to add two datasets. The first dataset is a field on a global grid (n field elements) and the second dataset is a global mean (1 field element). Before you can add these two datasets the second dataset have to be enlarged to the grid size of the first dataset:

```
cdo enlarge, infile1 infile2 tmpfile
cdo add infile1 tmpfile outfile
```

Or shorter using operator piping:

```
cdo add infile1 -enlarge,infile1 infile2 outfile
```
2.6.15. SETMISS - Set missing value

Synopsis

setmissval, newmiss  infile outfile
setctomiss, c  infile outfile
setmisstoc, c  infile outfile
setrtomiss, rmin, rmax  infile outfile
setvrange, rmin, rmax  infile outfile
setmisstonn  infile outfile
setmisstodis,[neighbors]  infile outfile

Description

This module sets part of a field to missing value or missing values to a constant value. Which part of the field is set depends on the chosen operator.

Operators

setmissval  Set a new missing value
\[
o(t, x) = \begin{cases} 
\text{newmiss} & \text{if } i(t, x) = \text{miss} \\
i(t, x) & \text{if } i(t, x) \neq \text{miss}
\end{cases}
\]

setctomiss  Set constant to missing value
\[
o(t, x) = \begin{cases} 
\text{miss} & \text{if } i(t, x) = c \\
i(t, x) & \text{if } i(t, x) \neq c
\end{cases}
\]

setmisstoc  Set missing value to constant
\[
o(t, x) = \begin{cases} 
c & \text{if } i(t, x) = \text{miss} \\
i(t, x) & \text{if } i(t, x) \neq \text{miss}
\end{cases}
\]

setrtomiss  Set range to missing value
\[
o(t, x) = \begin{cases} 
\text{miss} & \text{if } i(t, x) \geq rmin \land i(t, x) \leq rmax \\
i(t, x) & \text{if } i(t, x) < rmin \lor i(t, x) > rmax
\end{cases}
\]

setvrange  Set valid range
\[
o(t, x) = \begin{cases} 
\text{miss} & \text{if } i(t, x) < rmin \lor i(t, x) > rmax \\
i(t, x) & \text{if } i(t, x) \geq rmin \land i(t, x) \leq rmax
\end{cases}
\]

setmisstonn  Set missing value to nearest neighbor
Set all missing values to the nearest non missing value.
\[
o(t, x) = \begin{cases} 
i(t, y) & \text{if } i(t, x) = \text{miss} \land i(t, y) \neq \text{miss} \\
i(t, x) & \text{if } i(t, x) \neq \text{miss}
\end{cases}
\]

setmisstodis  Set missing value to distance-weighted average
Set all missing values to the distance-weighted average of the nearest non missing values. The default number of nearest neighbors is 4.

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>neighbors</td>
<td>INTEGER</td>
<td>Number of nearest neighbors</td>
</tr>
<tr>
<td>newmiss</td>
<td>FLOAT</td>
<td>New missing value</td>
</tr>
<tr>
<td>c</td>
<td>FLOAT</td>
<td>Constant</td>
</tr>
<tr>
<td>rmin</td>
<td>FLOAT</td>
<td>Lower bound</td>
</tr>
<tr>
<td>rmax</td>
<td>FLOAT</td>
<td>Upper bound</td>
</tr>
</tbody>
</table>
Example

setrtomiss

Assume an input dataset has one field with temperatures in the range from 246 to 304 Kelvin. To set all values below 273.15 Kelvin to missing value use:

```
cdo setrtomiss,0,273.15 infile outfile
```

Result of `cdo info infile`:

```
  1 : Date Time Code Level Size Miss : Minimum Mean Maximum
     : 1987-12-31 12:00:00 139 0 2048 0 : 246.27 276.75 303.71
```

Result of `cdo info outfile`:

```
  1 : Date Time Code Level Size Miss : Minimum Mean Maximum
     : 1987-12-31 12:00:00 139 0 2048 871 : 273.16 287.08 303.71
```

setmisstonn

Set all missing values to the nearest non missing value:

```
cdo setmisstonn infile outfile
```

Below is a schematic illustration of this example:

On the left side is input data with missing values in grey and on the right side the result with the filled missing values.
2.7. Arithmetic

This section contains modules to arithmetically process datasets.

Here is a short overview of all operators in this section:

- **expr**: Evaluate expressions
- **exprf**: Evaluate expressions script
- **aexpr**: Evaluate expressions and append results
- **aexprf**: Evaluate expression script and append results
- **abs**: Absolute value
- **int**: Integer value
- **nint**: Nearest integer value
- **pow**: Power
- **sqr**: Square
- **sqrt**: Square root
- **exp**: Exponential
- **ln**: Natural logarithm
- **log10**: Base 10 logarithm
- **sin**: Sine
- **cos**: Cosine
- **tan**: Tangent
- **asin**: Arc sine
- **acos**: Arc cosine
- **atan**: Arc tangent
- **reci**: Reciprocal value
- **not**: Logical NOT
- **addc**: Add a constant
- **subc**: Subtract a constant
- **mulc**: Multiply with a constant
- **divc**: Divide by a constant
- **minc**: Minimum of a field and a constant
- **maxc**: Maximum of a field and a constant
- **add**: Add two fields
- **sub**: Subtract two fields
- **mul**: Multiply two fields
- **div**: Divide two fields
- **min**: Minimum of two fields
- **max**: Maximum of two fields
- **atan2**: Arc tangent of two fields
- **monadd**: Add monthly time series
- **monsub**: Subtract monthly time series
- **monmul**: Multiply monthly time series
- **mondiv**: Divide monthly time series
- **yearadd**: Add yearly time series
- **yearsub**: Subtract yearly time series
- **yearmul**: Multiply yearly time series
- **yeardiv**: Divide yearly time series
<table>
<thead>

2.7.1. EXPR - Evaluate expressions

Synopsis

expr, instr infile outfile
exprf, filename infile outfile
aexpr, instr infile outfile
aexprf, filename infile outfile

Description

This module arithmetically processes every timestep of the input dataset. Each individual assignment statement have to end with a semi-colon. Unlike regular variables, temporary variables are never written to the output stream. To define a temporary variable simply prefix the variable name with an underscore (e.g. _varname) when the variable is declared.

The following operators are supported:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The following functions are supported:

Math intrinsics:

abs(x)  Absolute value of x
floor(x) Round to largest integral value not greater than x
ceil(x)  Round to smallest integral value not less than x
float(x) 32-bit float value of x
int(x)  Integer value of x
nint(x) Nearest integer value of x
sqr(x)  Square of x
sqrt(x)  Square Root of x
exp(x)  Exponential of x
ln(x)  Natural logarithm of x
log10(x)  Base 10 logarithm of x
sin(x)  Sine of x, where x is specified in radians
cos(x)  Cosine of x, where x is specified in radians	
tan(x)  Tangent of x, where x is specified in radians
asin(x)  Arc-sine of x, where x is specified in radians
acos(x)  Arc-cosine of x, where x is specified in radians
atan(x)  Arc-tangent of x, where x is specified in radians
rad(x)  Convert x from degrees to radians
deg(x)  Convert x from radians to degrees
rand(x)  Replace x by pseudo-random numbers in the range of 0 to 1
isMissval(x)  Returns 1 where x is missing

Coordinates:
clon(x)  Longitude coordinate of x (available only if x has geographical coordinates)
clat(x)  Latitude coordinate of x (available only if x has geographical coordinates)
gridarea(x)  Grid cell area of x (available only if x has geographical coordinates)
clev(x)  Level coordinate of x (0, if x is a 2D surface variable)
cldet(1)  Timestep number (1 to N)
cdate()  Verification date as YYYYMMDD
cetime()  Verification time as HHHHMMSS.millisecond
cdeltat()  Difference between current and last timestep in seconds
cday()  Day as DD
cmonth()  Month as MM
cyear()  Year as YYYY
csecond()  Second as MM.millisecond
cminute()  Minute as MM
chour()  Hour as HH

Constants:
ngp(x)  Number of horizontal grid points
nlev(x)  Number of vertical levels
size(x)  Total number of elements (ngp(x)*nlev(x))
missval(x)  Returns the missing value of variable x

Statistical values over a field:
fldmin(x), fldmax(x), fldsum(x), fldmean(x), fldavg(x), fldstd1(x), fldstdl1(x), fldvar(x), fldvar1(x)

Zonal statistical values for regular 2D grids:
zonmin(x), zonmax(x), zonsum(x), zonmean(x), zonavg(x), zonstd1(x), zonstdl1(x), zonvar(x), zonvar1(x)

Vertical statistical values:
vertmin(x), vertmax(x), vertsum(x), vertmean(x), vertavg(x), vertstd1(x), vertstdl1(x), vertvar(x), vertvar1(x)

Miscellaneous:
sellevel(x,k)    Select level k of variable x
sellevelidx(x,k) Select level index k of variable x
sellevelrange(x,k1,k2) Select all levels of variable x in the range k1 to k2
sellevelidxrange(x,k1,k2) Select all level indices of variable x in the range k1 to k2
remove(x)    Remove variable x from output stream

Operators

expr    Evaluate expressions
The processing instructions are read from the parameter.
exprf    Evaluate expressions script
Contrary to expr the processing instructions are read from a file.
aexpr    Evaluate expressions and append results
Same as expr, but keep input variables and append results
aexprf    Evaluate expression script and append results
Same as exprf, but keep input variables and append results

Parameter

instr STRING Processing instructions (need to be 'quoted' in most cases)
filename STRING File with processing instructions

Note

The expr commands sellevel(x,k) and sellevelidx(x,k) are only available with exprf/aexprf. If the input stream contains duplicate entries of the same variable name then the last one is used.

Example

Assume an input dataset contains at least the variables 'aprl', 'aprc' and 'ts'. To create a new variable 'var1' with the sum of 'aprl' and 'aprc' and a variable 'var2' which convert the temperature 'ts' from Kelvin to Celsius use:

```
cdo expr,'var1=aprl+aprc;var2=ts-273.15;' infile outfile
```

The same example, but the instructions are read from a file:

```
cdo exprf,myexpr infile outfile
```

The file myexpr contains:

```
var1 = aprl + aprc;
var2 = ts - 273.15;
```
2.7.2. MATH - Mathematical functions

Synopsis

<operator> infile outfile

Description

This module contains some standard mathematical functions. All trigonometric functions calculate with radians.

Operators

<table>

</tbody>
</table>

Example

To calculate the square root for all field elements use:

```
cdo sqrt infile outfile
```
2.7.3. ARITHC - Arithmetic with a constant

Synopsis

<operator>,c infile outfile

Description

This module performs simple arithmetic with all field elements of a dataset and a constant. The fields in outfile inherit the meta data from infile.

Operators

<table>
<thead>
<tr>
<th>Operator</th>

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>FLOAT</td>
<td>Constant</td>
</tr>
</tbody>
</table>

Example

To sum all input fields with the constant -273.15 use:

```
cdo addc,-273.15 infile outfile
```
2.7.4. ARITH - Arithmetic on two datasets

Synopsis

<operator> infile1 infile2 outfile

Description

This module performs simple arithmetic of two datasets. The number of fields in infile1 should be the same as in infile2. The fields in outfile inherit the meta data from infile1. One of the input files can contain only one timestep or one variable.

Operators

- **add**: Add two fields
  \[ o(t, x) = i_1(t, x) + i_2(t, x) \]

- **sub**: Subtract two fields
  \[ o(t, x) = i_1(t, x) - i_2(t, x) \]

- **mul**: Multiply two fields
  \[ o(t, x) = i_1(t, x) \times i_2(t, x) \]

- **div**: Divide two fields
  \[ o(t, x) = i_1(t, x)/i_2(t, x) \]

- **min**: Minimum of two fields
  \[ o(t, x) = \min(i_1(t, x), i_2(t, x)) \]

- **max**: Maximum of two fields
  \[ o(t, x) = \max(i_1(t, x), i_2(t, x)) \]

- **atan2**: Arc tangent of two fields
  The atan2 operator calculates the arc tangent of two fields. The result is in radians, which is between -PI and PI (inclusive).
  \[ o(t, x) = \text{atan2}(i_1(t, x), i_2(t, x)) \]

Example

To sum all fields of the first input file with the corresponding fields of the second input file use:

```
cdo add infile1 infile2 outfile
```
2.7.5. MONARITH - Monthly arithmetic

Synopsis

`<operator> infile1 infile2 outfile`

Description

This module performs simple arithmetic of a time series and one timestep with the same month and year. For each field in infile1 the corresponding field of the timestep in infile2 with the same month and year is used. The header information in infile1 have to be the same as in infile2. Usually infile2 is generated by an operator of the module MONSTAT.

Operators

- **monadd** Add monthly time series
  Adds a time series and a monthly time series.
- **monsub** Subtract monthly time series
  Subtracts a time series and a monthly time series.
- **monmul** Multiply monthly time series
  Multiplies a time series and a monthly time series.
- **mondiv** Divide monthly time series
  Divides a time series and a monthly time series.

Example

To subtract a monthly time average from a time series use:

```
cdo monsub infile -monavg infile outfile
```
2.7.6. YEARARITH - Yearly arithmetic

Synopsis

<operator> infile1 infile2 outfile

Description

This module performs simple arithmetic of a time series and one timestep with the same year. For each field in infile1 the corresponding field of the timestep in infile2 with the same year is used. The header information in infile1 have to be the same as in infile2. Usually infile2 is generated by an operator of the module YEARSTAT.

Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>yearadd</td>
<td>Add yearly time series</td>
</tr>
<tr>
<td></td>
<td>Adds a time series and a yearly time series.</td>
</tr>
<tr>
<td>yearsub</td>
<td>Subtract yearly time series</td>
</tr>
<tr>
<td></td>
<td>Subtracts a time series and a yearly time series.</td>
</tr>
<tr>
<td>yearmul</td>
<td>Multiply yearly time series</td>
</tr>
<tr>
<td></td>
<td>Multiplies a time series and a yearly time series.</td>
</tr>
<tr>
<td>yeardiv</td>
<td>Divide yearly time series</td>
</tr>
<tr>
<td></td>
<td>Divides a time series and a yearly time series.</td>
</tr>
</tbody>
</table>

Example

To subtract a yearly time average from a time series use:

```
cdo yearsub infile -yearavg infile outfile
```
2.7.7. YHOURARITH - Multi-year hourly arithmetic

Synopsis

<operator> infile1 infile2 outfile

Description

This module performs simple arithmetic of a time series and one timestep with the same hour and
day of year. For each field in infile1 the corresponding field of the timestep in infile2 with the
same hour and day of year is used. The header information in infile1 have to be the same as in
infile2. Usually infile2 is generated by an operator of the module YHOURSTAT.

Operators

yhouradd Add multi-year hourly time series
          Adds a time series and a multi-year hourly time series.

yhounsub Subtract multi-year hourly time series
          Subtracts a time series and a multi-year hourly time series.

yhourmul Multiply multi-year hourly time series
          Multiplies a time series and a multi-year hourly time series.

yhourdiv Divide multi-year hourly time series
          Divides a time series and a multi-year hourly time series.

Example

To subtract a multi-year hourly time average from a time series use:

    cdo yhoursub infile -yhouravg infile outfile
2.7.8. YDAYARITH - Multi-year daily arithmetic

Synopsis

<operator> infile1 infile2 outfile

Description

This module performs simple arithmetic of a time series and one timestep with the same day of year. For each field in `infile1` the corresponding field of the timestep in `infile2` with the same day of year is used. The header information in `infile1` have to be the same as in `infile2`. Usually `infile2` is generated by an operator of the module YDAYSTAT.

Operators

ydayadd Add multi-year daily time series
- Adds a time series and a multi-year daily time series.
ydaysub Subtract multi-year daily time series
- Subtracts a time series and a multi-year daily time series.
ydaymul Multiply multi-year daily time series
- Multiplies a time series and a multi-year daily time series.
ydaydiv Divide multi-year daily time series
- Divides a time series and a multi-year daily time series.

Example

To subtract a multi-year daily time average from a time series use:

```
cdo ydaysub infile -ydayavg infile outfile
```
2.7.9. YMONARITH - Multi-year monthly arithmetic

Synopsis

(operator) infile1 infile2 outfile

Description

This module performs simple arithmetic of a time series and one timestep with the same month of year. For each field in infile1 the corresponding field of the timestep in infile2 with the same month of year is used. The header information in infile1 have to be the same as in infile2. Usually infile2 is generated by an operator of the module YMONSTAT.

Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ymonadd</td>
<td>Add multi-year monthly time series</td>
</tr>
<tr>
<td></td>
<td>Adds a time series and a multi-year monthly time series.</td>
</tr>
<tr>
<td>ymonsub</td>
<td>Subtract multi-year monthly time series</td>
</tr>
<tr>
<td></td>
<td>Subtracts a time series and a multi-year monthly time series.</td>
</tr>
<tr>
<td>ymonmul</td>
<td>Multiply multi-year monthly time series</td>
</tr>
<tr>
<td></td>
<td>Multiplies a time series and a multi-year monthly time series.</td>
</tr>
<tr>
<td>ymondiv</td>
<td>Divide multi-year monthly time series</td>
</tr>
<tr>
<td></td>
<td>Divides a time series and a multi-year monthly time series.</td>
</tr>
</tbody>
</table>

Example

To subtract a multi-year monthly time average from a time series use:

cdo ymonsub infile -ymonavg infile outfile
2.7.10. YSEASARITH - Multi-year seasonal arithmetic

Synopsis

<operator> infile1 infile2 outfile

Description

This module performs simple arithmetic of a time series and one timestep with the same season. For each field in infile1 the corresponding field of the timestep in infile2 with the same season is used. The header information in infile1 have to be the same as in infile2. Usually infile2 is generated by an operator of the module YSEASSTAT.

Operators

- **yseasadd**: Add multi-year seasonal time series
- **yseassub**: Subtract multi-year seasonal time series
- **yseasmul**: Multiply multi-year seasonal time series
- **yseasdiv**: Divide multi-year seasonal time series

Example

To subtract a multi-year seasonal time average from a time series use:

```
cdo yseassub infile -yseasavg infile outfile
```

2.7.11. ARITHDAYS - Arithmetic with days

Synopsis

<operator> infile outfile

Description

This module multiplies or divides each timestep of a dataset with the corresponding days per month or days per year. The result of these functions depends on the used calendar of the input data.

Operators

- **muldpm**: Multiply with days per month
  \[ o(t,x) = i(t,x) \times \text{days\_per\_month} \]
- **divdpm**: Divide by days per month
  \[ o(t,x) = i(t,x)/\text{days\_per\_month} \]
- **muldpy**: Multiply with days per year
  \[ o(t,x) = i(t,x) \times \text{days\_per\_year} \]
- **divdpy**: Divide by days per year
  \[ o(t,x) = i(t,x)/\text{days\_per\_year} \]
2.8. Statistical values

This section contains modules to compute statistical values of datasets. In this program there is the different notion of 'mean' and 'average' to distinguish two different kinds of treatment of missing values. While computing the mean, only the not missing values are considered to belong to the sample with the side effect of a probably reduced sample size. Computing the average is just adding the sample members and divide the result by the sample size. For example, the mean of 1, 2, miss and 3 is \( \frac{1+2+3}{3} = 2 \), whereas the average is \( \frac{1+2+\text{miss}+3}{4} = \frac{\text{miss}}{4} = \text{miss} \). If there are no missing values in the sample, the average and the mean are identical.

CDO is using the verification time to identify the time range for temporal statistics. The time bounds are never used!

In this section the abbreviations as in the following table are used:

<table>
<thead>
<tr>
<th></th>
<th>( n \sum_{i=1}^{n} x_i )</th>
<th>( n^{-1} \sum_{i=1}^{n} x_i )</th>
</tr>
</thead>
<tbody>
<tr>
<td>mean</td>
<td>( \bar{x} )</td>
<td>( \frac{1}{n} \sum_{i=1}^{n} x_i )</td>
</tr>
<tr>
<td>avg</td>
<td>( \bar{x} )</td>
<td>( \frac{1}{n} \sum_{i=1}^{n} x_i )</td>
</tr>
<tr>
<td>weighted avg</td>
<td>( \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{i=1}^{n} w_i x_i \right) )</td>
<td>( \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{i=1}^{n} w_i \right) \left( \sum_{j=1}^{n} w_j x_j \right) )</td>
</tr>
</tbody>
</table>

Variance

\[ \text{var} \quad n^{-1} \sum_{i=1}^{n} (x_i - \bar{x})^2 \]

\[ \text{var1} \quad (n - 1)^{-1} \sum_{i=1}^{n} (x_i - \bar{x})^2 \]

\[ \text{var} \quad \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{i=1}^{n} w_i \right) \left( x_i - \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{j=1}^{n} w_j x_j \right) \right)^2 \]

Standard deviation

\[ s \quad \sqrt{n^{-1} \sum_{i=1}^{n} (x_i - \bar{x})^2} \]

\[ \text{std1} \quad \sqrt{(n - 1)^{-1} \sum_{i=1}^{n} (x_i - \bar{x})^2} \]

\[ \text{std} \quad \sqrt{\left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{i=1}^{n} w_i \right) \left( x_i - \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{j=1}^{n} w_j x_j \right) \right)^2} \]
Kurtosis \[ \sum_{i=1}^{n} (x_i - \bar{x})^4 / n \]
\[ s^4 \]

Skewness \[ \sum_{i=1}^{n} (x_i - \bar{x}) / n \]
\[ s^3 \]

Cumulative Ranked Probability Score \[ \int_{-\infty}^{\infty} [H(x_1) - \text{cdf}([x_2 \ldots x_n])|_r]^2 \text{d}r \]

with \( \text{cdf}(X)|_r \) being the cumulative distribution function of \( \{x_i, i = 2 \ldots n\} \) at \( r \)
and \( H(x) \) the Heaviside function jumping at \( x \).

Here is a short overview of all operators in this section:

- **timcumsum**: Cumulative sum over all timesteps
- **consecsum**: Consecutive Sum
- **consects**: Consecutive Timesteps
- **varsmin**: Variables minimum
- **varsmax**: Variables maximum
- **varsrange**: Variables range
- **varssum**: Variables sum
- **varsmean**: Variables mean
- **varsavg**: Variables average
- **varsstd**: Variables standard deviation
- **varsstd1**: Variables standard deviation (n-1)
- **varsvar**: Variables variance
- **varsvar1**: Variables variance (n-1)
- **ensmin**: Ensemble minimum
- **ensmax**: Ensemble maximum
- **ensrange**: Ensemble range
- **enssum**: Ensemble sum
- **ensmean**: Ensemble mean
- **ensavg**: Ensemble average
- **enstd**: Ensemble standard deviation
- **enstd1**: Ensemble standard deviation (n-1)
- **ensvar**: Ensemble variance
- **ensvar1**: Ensemble variance (n-1)
- **enspctl**: Ensemble percentiles
- **ensrkhistspace**: Ranked Histogram averaged over time
- **ensrkhisttime**: Ranked Histogram averaged over space
- **ensroc**: Ensemble Receiver Operating characteristics
- **enscrps**: Ensemble CRPS and decomposition
- **ensbrs**: Ensemble Brier score

2.8.1. TIMCUMSUM - Cumulative sum over all timesteps

Synopsis

timcumsum infile outfile

Description

The timcumsum operator calculates the cumulative sum over all timesteps. Missing values are treated as numeric zero when summing.

\[ o(t, x) = \sum \{ i(t', x), 0 < t' \leq t \} \]

2.8.2. CONSECSTAT - Consecutive timestep periods

Synopsis

<operator> infile outfile

Description

This module computes periods over all timesteps in infile where a certain property is valid. The property can be chosen by creating a mask from the original data, which is the expected input format for operators of this module. Depending on the operator full information about each period or just its length and ending date are computed.

Operators

- **consecsum**  
  Consecutive Sum  
  This operator computes periods of consecutive timesteps similar to a runsum, but periods are finished, when the mask value is 0. That way multiple periods can be found. Timesteps from the input are preserved. Missing values are handled like 0, i.e. finish periods of consecutive timesteps.

- **consects**  
  Consecutive Timesteps  
  In contrast to the operator above consects only computes the length of each period together with its last timestep. To be able to perform statistical analysis like min, max or mean, everything else is set to missing value.

Example

For a given time series of daily temperatures, the periods of summer days can be calculated with inplace masking the input field:

```
cdo consects -gtc,20.0 infile1 outfile
```
2.8.3. VARSSTAT - Statistical values over all variables

Synopsis

\[
\text{\textless{}operator\textgreater{}} \text{ infile outfile}
\]

Description

This module computes statistical values over all variables for each timestep. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation is written to outfile. All input variables need to have the same gridsize and the same number of levels.

Operators

- **varsmin**  
  Variables minimum  
  For every timestep the minimum over all variables is computed.

- **varsmax**  
  Variables maximum  
  For every timestep the maximum over all variables is computed.

- **varsrange**  
  Variables range  
  For every timestep the range over all variables is computed.

- **varssum**  
  Variables sum  
  For every timestep the sum over all variables is computed.

- **varsmean**  
  Variables mean  
  For every timestep the mean over all variables is computed.

- **varsavg**  
  Variables average  
  For every timestep the average over all variables is computed.

- **varsstd**  
  Variables standard deviation  
  For every timestep the standard deviation over all variables is computed. Normalize by n.

- **varsstd1**  
  Variables standard deviation (n-1)  
  For every timestep the standard deviation over all variables is computed. Normalize by (n-1).

- **varsvar**  
  Variables variance  
  For every timestep the variance over all variables is computed. Normalize by n.

- **varsvar1**  
  Variables variance (n-1)  
  For every timestep the variance over all variables is computed. Normalize by (n-1).
2.8.4. ENSSTAT - Statistical values over an ensemble

Synopsis

<operator> infiles outfile
enspctl,p infiles outfile

Description

This module computes statistical values over an ensemble of input files. Depending on the chosen operator the minimum, maximum, range, sum, average, variance, standard deviation or a certain percentile over all input files is written to outfile. All input files need to have the same structure with the same variables. The date information of a timestep in outfile is the date of the first input file.

</table>

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$p$</td>
<td>FLOAT</td>
<td>Percentile number in 0, ..., 100</td>
</tr>
</tbody>
</table>
Note

This operator needs to open all input files simultaneously. The maximum number of open files depends on the operating system!

Example

To compute the ensemble mean over 6 input files use:

```
cdo ensmean infile1 infile2 infile3 infile4 infile5 infile6 outfile
```

Or shorter with filename substitution:

```
cdo ensmean infile[1-6] outfile
```

To compute the 50th percentile (median) over 6 input files use:

```
cdo enspctl,50 infile1 infile2 infile3 infile4 infile5 infile6 outfile
```
2.8.5. ENSSTAT2 - Statistical values over an ensemble

Synopsis

<operator> obsfile ensfiles outfile

Description

This module computes statistical values over the ensemble of ensfiles using obsfile as a reference. Depending on the operator a ranked Histogram or a roc-curve over all Ensembles ensfiles with reference to obsfile is written to outfile. The date and grid information of a timestep in outfile is the date of the first input file. Thus all input files are required to have the same structure in terms of the gridsize, variable definitions and number of timesteps.

All Operators in this module use obsfile as the reference (for instance an observation) whereas ensfiles are understood as an ensemble consisting of n (where n is the number of ensfiles) members.

The operators ensrkhistspace and ensrkhisttime compute Ranked Histograms. Therefor the vertical axis is utilized as the Histogram axis, which prohibits the use of files containing more than one level. The histogram axis has nensfiles+1 bins with level 0 containing for each grid point the number of observations being smaller as all ensembles and level nensfiles+1 indicating the number of observations being larger than all ensembles.

ensrkhistspace computes a ranked histogram at each timestep reducing each horizontal grid to a 1x1 grid and keeping the time axis as in obsfile. Contrary ensrkhistspace computes a histogram at each grid point keeping the horizontal grid for each variable and reducing the time-axis. The time information is that from the last timestep in obsfile.

Operators

ensrkhistspace  Ranked Histogram averaged over time
ensrkhisttime   Ranked Histogram averaged over space
ensroc          Ensemble Receiver Operating characteristics

Example

To compute a rank histogram over 5 input files ensfile1-ensfile5 given an observation in obsfile use:

cdo ensrkhisttime obsfile ensfile1 ensfile2 ensfile3 ensfile4 ensfile5 outfile

Or shorter with filename substitution:

cdo ensrkhisttime obsfile ensfile[1-5] outfile
2.8.6. ENSVAL - Ensemble validation tools

Synopsis

\texttt{enscrps rfile infiles outfilebase}
\texttt{ensbrs x rfile infiles outfilebase}

Description

This module computes ensemble validation scores and their decomposition such as the Brier and cumulative ranked probability score (CRPS). The first file is used as a reference it can be a climatology, observation or reanalysis against which the skill of the ensembles given in infiles is measured. Depending on the operator a number of output files is generated each containing the skill score and its decomposition corresponding to the operator. The output is averaged over horizontal fields using appropriate weights for each level and timestep in rfile.

All input files need to have the same structure with the same variables. The date information of a timestep in outfile is the date of the first input file. The output files are named as <outfilebase>.<type>.<filesuffix> where <type> depends on the operator and <filesuffix> is determined from the output file type. There are three output files for operator enscrips and four output files for operator ensbrs.

The CRPS and its decomposition into Reliability and the potential CRPS are calculated by an appropriate averaging over the field members (note, that the CRPS does *not* average linearly). In the three output files <type> has the following meaning: crps for the CRPS, reli for the reliability and crpspot for the potential crps. The relation \( \text{CRPS} = \text{CRPS}_{pot} + \text{RELI} \) holds.

The Brier score of the Ensemble given by infiles with respect to the reference given in rfile and the threshold x is calculated. In the four output files <type> has the following meaning: brs for the Brier score wrt threshold x; brsreli for the Brier score reliability wrt threshold x; brsreso for the Brier score resolution wrt threshold x; brsunct for the Brier score uncertainty wrt threshold x. In analogy to the CRPS the following relation holds: \( \text{BRS}(x) = \text{RELI}(x) - \text{RESO}(x) + \text{UNCT}(x) \).

The CRPS code decomposition has been verified against the CRAN - ensemble validation package from R. Differences occur when grid-cell area is not uniform as the implementation in R does not account for that.

Operators

\texttt{enscrps} Ensemble CRPS and decomposition
\texttt{ensbrs} Ensemble Brier score
\texttt{ensbrs x} Ensemble Brier Score and Decomposition

Example

To compute the field averaged Brier score at x=5 over an ensemble with 5 members ensfile1-5 w.r.t. the reference rfile and write the results to files obase.brs.<suffix>, obase.brssreli.<suffix>, obase.brssreso.<suffix>, obase.brssunct.<suffix> where <suffix> is determined from the output file type, use

\texttt{cdo ensbrs,5 rfile ensfile1 ensfile2 ensfile3 ensfile4 ensfile5 obase}
or shorter using file name substitution:

```
cdo ensbrs,5 rfile ensfile[1-5] obase
```
2.8.7. FLDSTAT - Statistical values over a field

Synopsis

<operator>,weights infile outfile

fldpctl,p infile outfile

Description

This module computes statistical values of all input fields. A field is a horizontal layer of a data variable. According to the chosen operator the field minimum, maximum, range, sum, average, variance, standard deviation or a certain percentile is written to outfile.

Operators

fldmin   Field minimum
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \min\{i(t, x'), x_1 < x' \leq x_n\}
\]

fldmax   Field maximum
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \max\{i(t, x'), x_1 < x' \leq x_n\}
\]

fldrange Field range
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{range}\{i(t, x'), x_1 < x' \leq x_n\}
\]

fldsum   Field sum
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \sum\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.

fldmean  Field mean
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{mean}\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.

fldavg   Field average
For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{avg}\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.

fldstd   Field standard deviation
Normalize by n. For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{std}\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.

fldstd1  Field standard deviation (n-1)
Normalize by (n-1). For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{std1}\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.

fldvar   Field variance
Normalize by n. For every gridpoint \(x_1, \ldots, x_n\) of the same field it is:
\[
o(t, 1) = \text{var}\{i(t, x'), x_1 < x' \leq x_n\}
\]

weighted by area weights obtained by the input field.
**fldvar1**  
Field variance (n-1)  
Normalize by (n-1). For every gridpoint $x_1, ..., x_n$ of the same field it is:  
$$o(t,1) = \text{var1}\{i(t,x'), x_1 < x' \leq x_n\}$$
weighted by area weights obtained by the input field.

**fldpctl**  
Field percentiles  
For every gridpoint $x_1, ..., x_n$ of the same field it is:  
$$o(t,1) = \text{pth percentile}\{i(t,x'), x_1 < x' \leq x_n\}$$

### Parameter

- **weights**  
  **BOOL**  
  weights=FALSE disables weighting by grid cell area [default: weights=TRUE]

- **p**  
  **FLOAT**  
  Percentile number in 0, ..., 100

### Example

To compute the field mean of all input fields use:

```
cdo fldmean infile outfile
```

To compute the 90th percentile of all input fields use:

```
cdo fldpctl,90 infile outfile
```
2.8.8. **ZONSTAT - Zonal statistical values**

**Synopsis**

```
<operator> infile outfile
zonpctl,p infile outfile
```

**Description**

This module computes zonal statistical values of the input fields. According to the chosen operator the zonal minimum, maximum, range, sum, average, variance, standard deviation or a certain percentile is written to outfile. This operator requires all variables on the same regular lon/lat grid.

**Operators**

- **zonmin** Zonal minimum
  - For every latitude the minimum over all longitudes is computed.
- **zonmax** Zonal maximum
  - For every latitude the maximum over all longitudes is computed.
- **zonrange** Zonal range
  - For every latitude the range over all longitudes is computed.
- **zonsum** Zonal sum
  - For every latitude the sum over all longitudes is computed.
- **zonmean** Zonal mean
  - For every latitude the mean over all longitudes is computed.
- **zonavg** Zonal average
  - For every latitude the average over all longitudes is computed.
- **zonstd** Zonal standard deviation
  - For every latitude the standard deviation over all longitudes is computed. Normalize by \( n \).
- **zonstd1** Zonal standard deviation (n-1)
  - For every latitude the standard deviation over all longitudes is computed. Normalize by \( (n-1) \).
- **zonvar** Zonal variance
  - For every latitude the variance over all longitudes is computed. Normalize by \( n \).
- **zonvar1** Zonal variance (n-1)
  - For every latitude the variance over all longitudes is computed. Normalize by \( (n-1) \).
- **zonpctl** Zonal percentiles
  - For every latitude the pth percentile over all longitudes is computed.

**Parameter**

- **p** FLOAT Percentile number in 0, ..., 100

**Example**

To compute the zonal mean of all input fields use:

```
cdo zonmean infile outfile
```

To compute the 50th meridional percentile (median) of all input fields use:

```
cdo zonpctl,50 infile outfile
```
2.8.9. MERSTAT - Meridional statistical values

Synopsis

<operator> infile outfile
merpctl,p infile outfile

Description

This module computes meridional statistical values of the input fields. According to the chosen operator the meridional minimum, maximum, range, sum, average, variance, standard deviation or a certain percentile is written to outfile. This operator requires all variables on the same regular lon/lat grid.

Operators

mermin Meridional minimum
For every longitude the minimum over all latitudes is computed.
mermax Meridional maximum
For every longitude the maximum over all latitudes is computed.
merrange Meridional range
For every longitude the range over all latitudes is computed.
mersum Meridional sum
For every longitude the sum over all latitudes is computed.
mermean Meridional mean
For every longitude the area weighted mean over all latitudes is computed.
meravg Meridional average
For every longitude the area weighted average over all latitudes is computed.
merstd Meridional standard deviation
For every longitude the standard deviation over all latitudes is computed. Normalize by n.
merstd1 Meridional standard deviation (n-1)
For every longitude the standard deviation over all latitudes is computed. Normalize by (n-1).
mervar Meridional variance
For every longitude the variance over all latitudes is computed. Normalize by n.
mervar1 Meridional variance (n-1)
For every longitude the variance over all latitudes is computed. Normalize by (n-1).
merpctl Meridional percentiles
For every longitude the pth percentile over all latitudes is computed.

Parameter

p FLOAT Percentile number in 0, ..., 100
Example

To compute the meridional mean of all input fields use:

```
cdo mermean infile outfile
```

To compute the 50th meridional percentile (median) of all input fields use:

```
cdo merpctl,50 infile outfile
```
2.8.10. GRIDBOXSTAT - Statistical values over grid boxes

Synopsis

<operator>,nx,ny infile outfile

Description

This module computes statistical values over surrounding grid boxes. According to the chosen operator
the minimum, maximum, range, sum, average, variance, or standard deviation of the neighboring grid
boxes is written to outfile. All gridbox operators only works on quadrilateral curvilinear grids.

Operators

- **gridboxmin**: Gridbox minimum
  Minimum value of the selected grid boxes.
- **gridboxmax**: Gridbox maximum
  Maximum value of the selected grid boxes.
- **gridboxrange**: Gridbox range
  Range (max-min value) of the selected grid boxes.
- **gridboxsum**: Gridbox sum
  Sum of the selected grid boxes.
- **gridboxmean**: Gridbox mean
  Mean of the selected grid boxes.
- **gridboxavg**: Gridbox average
  Average of the selected grid boxes.
- **gridboxstd**: Gridbox standard deviation
  Standard deviation of the selected grid boxes. Normalize by n.
- **gridboxstd1**: Gridbox standard deviation (n-1)
  Standard deviation of the selected grid boxes. Normalize by (n-1).
- **gridboxvar**: Gridbox variance
  Variance of the selected grid boxes. Normalize by n.
- **gridboxvar1**: Gridbox variance (n-1)
  Variance of the selected grid boxes. Normalize by (n-1).

Parameter

- **nx**: INTEGER
  Number of grid boxes in x direction
- **ny**: INTEGER
  Number of grid boxes in y direction

Example

To compute the mean over 10x10 grid boxes of the input field use:

```
cdo gridboxmean,10,10 infile outfile
```
2.8.11. VERTSTAT - Vertical statistical values

Synopsis

<operator>,weights infile outfile

Description

This module computes statistical values over all levels of the input variables. According to chosen operator the vertical minimum, maximum, range, sum, average, variance or standard deviation is written to outfile.

Operators

vertmin  Vertical minimum
For every gridpoint the minimum over all levels is computed.

vertmax  Vertical maximum
For every gridpoint the maximum over all levels is computed.

vertrange  Vertical range
For every gridpoint the range over all levels is computed.

vertsum  Vertical sum
For every gridpoint the sum over all levels is computed.

vertmean  Vertical mean
For every gridpoint the layer weighted mean over all levels is computed.

vertavg  Vertical average
For every gridpoint the layer weighted average over all levels is computed.

vertstd  Vertical standard deviation
For every gridpoint the standard deviation over all levels is computed. Normalize by n.

vertstd1  Vertical standard deviation (n-1)
For every gridpoint the standard deviation over all levels is computed. Normalize by (n-1).

vertvar  Vertical variance
For every gridpoint the variance over all levels is computed. Normalize by n.

vertvar1  Vertical variance (n-1)
For every gridpoint the variance over all levels is computed. Normalize by (n-1).

Parameter

weights  BOOL    weights=FALSE disables weighting by layer thickness [default: weights=TRUE]

Example

To compute the vertical sum of all input variables use:

```
cdo vertsum infile outfile
```
2.8.12. TIMSELSTAT - Time range statistical values

Synopsis

<operator>,nsets[,noffset[,nskip]] infile outfile

Description

This module computes statistical values for a selected number of timesteps. According to the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of the selected timesteps is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

- **timselmin** Time selection minimum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \min\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselmax** Time selection maximum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \max\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselrange** Time selection range
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{range}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselsum** Time selection sum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{sum}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselmean** Time selection mean
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{mean}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselavg** Time selection average
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{avg}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselstd** Time selection standard deviation
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{std}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselstd1** Time selection standard deviation (n-1)
  Normalize by (n-1). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{std1}\{i(t', x), t_1 < t' \leq t_n\} \]

- **timselvar** Time selection variance
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same selected time range it is:
  \[ o(t, x) = \text{var}\{i(t', x), t_1 < t' \leq t_n\} \]
**timselvar1**

Time selection variance (n-1)

Normalize by (n-1). For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same selected time range it is:

\[
o(t, x) = \frac{\text{var} \{ i(t', x), t_1 < t' \leq t_n \}}{n-1}
\]

**Parameter**

- **nsets** INTEGER  Number of input timesteps for each output timestep
- **noffset** INTEGER  Number of input timesteps skipped before the first timestep range (optional)
- **nskip** INTEGER  Number of input timesteps skipped between timestep ranges (optional)

**Example**

Assume an input dataset has monthly means over several years. To compute seasonal means from monthly means the first two month have to be skipped:

```
cdo timselmean,3,2 infile outfile
```

### 2.8.13. TIMSELPCTL - Time range percentile values

**Synopsis**

```
timselpctl,p,nsets[,noffset[,nskip]] infile1 infile2 infile3 outfile
```

**Description**

This operator computes percentile values over a selected number of timesteps in `infile1`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by setting the environment variable `CDO_PCTL_NBINS` to a different value. The files `infile2` and `infile3` should be the result of corresponding `timselmin` and `timselmax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be change with the **CDO** option `–timestat_date <first|middle|last>`.

For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same selected time range it is:

\[
o(t, x) = \text{pth percentile} \{ i(t', x), t_1 < t' \leq t_n \}
\]

**Parameter**

- **p** FLOAT  Percentile number in 0, ..., 100
- **nsets** INTEGER  Number of input timesteps for each output timestep
- **noffset** INTEGER  Number of input timesteps skipped before the first timestep range (optional)
- **nskip** INTEGER  Number of input timesteps skipped between timestep ranges (optional)

**Environment**

- **CDO_PCTL_NBINS**  Sets the number of histogram bins. The default number is 101.
2.8.14. RUNSTAT - Running statistical values

Synopsis

<operator>,nts infile outfile

Description

This module computes running statistical values over a selected number of timesteps. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of a selected number of consecutive timesteps read from infile is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

- **runmin**: Running minimum
  \[ o(t + \frac{(nts - 1)}{2}, x) = \min\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runmax**: Running maximum
  \[ o(t + \frac{(nts - 1)}{2}, x) = \max\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runrange**: Running range
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{range}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runsum**: Running sum
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{sum}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runmean**: Running mean
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{mean}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runavg**: Running average
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{avg}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runstd**: Running standard deviation
  Normalize by n.
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{std}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runstd1**: Running standard deviation (n-1)
  Normalize by (n-1).
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{std1}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runvar**: Running variance
  Normalize by n.
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{var}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

- **runvar1**: Running variance (n-1)
  Normalize by (n-1).
  \[ o(t + \frac{(nts - 1)}{2}, x) = \text{var1}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\} \]

Parameter

- **nts**: INTEGER Number of timesteps

Environment

- **CDO_TIMESTAT_DATE**: Sets the time stamp in outfile to the 'first', 'middle' or 'last' contributing timestep of infile.
Example

To compute the running mean over 9 timesteps use:

```bash
  cdo runmean,9 infile outfile
```

2.8.15. RUNPCTL - Running percentile values

Synopsis

```bash
  runpctl,p,nts infile outfile
```

Description

This module computes running percentiles over a selected number of timesteps in `infile`. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile`. This can be changed with the CDO option `-timestat_date <first|middle|last>`.

\[
o(t + (nts - 1)/2, x) = \text{pth percentile}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}
\]

Parameter

- `p` FLOAT  Percentile number in 0, ..., 100
- `nts` INTEGER Number of timesteps

Example

To compute the running 50th percentile (median) over 9 timesteps use:

```bash
  cdo runpctl,50,9 infile outfile
```
2.8.16. TIMSTAT - Statistical values over all timesteps

Synopsis

<operator> infile outfile

Description

This module computes statistical values over all timesteps in infile. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of all timesteps read from infile is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

- **timmin**    Time minimum
  \[ o(1, x) = \min \{i(t', x), t_1 < t' \leq t_n \} \]
- **timmax**    Time maximum
  \[ o(1, x) = \max \{i(t', x), t_1 < t' \leq t_n \} \]
- **timrange**  Time range
  \[ o(1, x) = \text{range}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timsum**    Time sum
  \[ o(1, x) = \sum\{i(t', x), t_1 < t' \leq t_n \} \]
- **timmean**   Time mean
  \[ o(1, x) = \text{mean}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timavg**    Time average
  \[ o(1, x) = \text{avg}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timmstd**   Time standard deviation
  Normalize by n.
  \[ o(1, x) = \text{std}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timmstd1**  Time standard deviation (n-1)
  Normalize by (n-1).
  \[ o(1, x) = \text{std1}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timvar**    Time variance
  Normalize by n.
  \[ o(1, x) = \text{var}\{i(t', x), t_1 < t' \leq t_n \} \]
- **timvar1**   Time variance (n-1)
  Normalize by (n-1).
  \[ o(1, x) = \text{var1}\{i(t', x), t_1 < t' \leq t_n \} \]

Example

To compute the mean over all input timesteps use:

```
cdo timmean infile outfile
```
2.8.17. TIMPCTL - Percentile values over all timesteps

Synopsis

timpctl,p infile1 infile2 infile3 outfile

Description

This operator computes percentiles over all timesteps in infile1. The algorithm uses histograms with minimum and maximum bounds given in infile2 and infile3, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable CDO_PCTL_NBINS. The files infile2 and infile3 should be the result of corresponding timmin and timmax operations, respectively. The time of outfile is determined by the time in the middle of all contributing timesteps of infile1. This can be change with the CDO option –timestat_date <first|middle|last>.

\[ o(1, x) = \text{pth percentile}\{i(t', x), t_1 < t' \leq t_n\} \]

Parameter

\[ p \quad \text{FLOAT} \quad \text{Percentile number in 0, ..., 100} \]

Environment

\[ \text{CDO_PCTL_NBINS} \quad \text{Sets the number of histogram bins. The default number is 101.} \]

Example

To compute the 90th percentile over all input timesteps use:

\[
\begin{align*}
\text{cdo timmin infile minfile} \\
\text{cdo timmax infile maxfile} \\
\text{cdo timpctl,90 infile minfile maxfile outfile}
\end{align*}
\]

Or shorter using operator piping:

\[
\begin{align*}
\text{cdo timpctl,90 infile -timmin infile -timmax infile outfile}
\end{align*}
\]
2.8.18. HOURSTAT - Hourly statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values over timesteps of the same hour. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of timesteps of the same hour is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

- **hourmin** Hourly minimum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \min \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourmax** Hourly maximum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \max \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourrange** Hourly range
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{range} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hoursum** Hourly sum
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \sum \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourmean** Hourly mean
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{mean} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **houravg** Hourly average
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{avg} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourstd** Hourly standard deviation
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{std} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourstd1** Hourly standard deviation (n-1)
  Normalize by (n-1). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{std1} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourvar** Hourly variance
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{var} \{ i(t', x), t_1 < t' \leq t_n \} \]

- **hourvar1** Hourly variance (n-1)
  Normalize by (n-1). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same hour it is:
  \[ o(t, x) = \text{var1} \{ i(t', x), t_1 < t' \leq t_n \} \]
Example

To compute the hourly mean of a time series use:

```bash
cdo hourmean infile outfile
```

2.8.19. HOURPCTL - Hourly percentile values

Synopsis

```
hourpctl,p infile1 infile2 infile3 outfile
```

Description

This operator computes percentiles over all timesteps of the same hour in `infile1`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable `CDO_PCTL_NBINS`. The files `infile2` and `infile3` should be the result of corresponding `hourmin` and `hourmax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be change with the `CDO` option `-timestat_date <first|middle|last>`.

For every adjacent sequence `t_1, ..., t_n` of timesteps of the same hour it is:

\[
o(t, x) = p\text{th percentile}\{i(t', x), t_1 < t' \leq t_n\}
\]

Parameter

\[
p\text{ FLOAT \hspace{1cm} Percentile number in 0, ..., 100}
\]

Environment

```
CDO_PCTL_NBINS \hspace{1cm} Sets the number of histogram bins. The default number is 101.
```

Example

To compute the hourly 90th percentile of a time series use:

```bash
cdo hourmin infile minfile
cdo hourmax infile maxfile
cdo hourpctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```bash
cdo hourpctl,90 infile -hourmin infile -hourmax infile outfile
```
2.8.20. DAYSTAT - Daily statistical values

Synopsis

\(<\text{operator}>\) infile outfile

Description

This module computes statistical values over timesteps of the same day. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of timesteps of the same day is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

- \textbf{daymin} Daily minimum
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \min\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{daymax} Daily maximum
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \max\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{dayrange} Daily range
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{range}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{daysum} Daily sum
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{sum}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{daymean} Daily mean
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{mean}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{dayavg} Daily average
  For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{avg}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{daystd} Daily standard deviation
  Normalize by \(n\). For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{std}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{daystd1} Daily standard deviation (n-1)
  Normalize by \((n-1)\). For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{std1}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{dayvar} Daily variance
  Normalize by \(n\). For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{var}\{i(t', x), t_1 < t' \leq t_n\} \]

- \textbf{dayvar1} Daily variance (n-1)
  Normalize by \((n-1)\). For every adjacent sequence \(t_1, \ldots, t_n\) of timesteps of the same day it is:
  \[ o(t, x) = \text{var1}\{i(t', x), t_1 < t' \leq t_n\} \]
Example

To compute the daily mean of a time series use:

```
cdo daymean infile outfile
```

2.8.21. DAYPCTL - Daily percentile values

Synopsis

```
daypctl,p infile1 infile2 infile3 outfile
```

Description

This operator computes percentiles over all timesteps of the same day in `infile1`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable `CDO_PCTL_NBINS`. The files `infile2` and `infile3` should be the result of corresponding `daymin` and `daymax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be changed with the `CDO` option `-timestat_date <first|middle|last>`.

For every adjacent sequence \(t_{-1},...,t_n\) of timesteps of the same day it is:

\[ o(t,x) = \text{pth percentile}\{i(t',x), t_1 < t' \leq t_n\} \]

Parameter

\( p \quad \text{FLOAT} \quad \text{Percentile number in 0, ..., 100} \)

Environment

`CDO_PCTL_NBINS` Sets the number of histogram bins. The default number is 101.

Example

To compute the daily 90th percentile of a time series use:

```
cdo daymin infile minfile
cdo daymax infile maxfile
cdo daypctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo daypctl,90 infile -daymin infile -daymax infile outfile
```
2.8.22. MONSTAT - Monthly statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values over timesteps of the same month. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of timesteps of the same month is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

monmin  Monthly minimum
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \min \{ i(t', x), t_1 < t' \leq t_n \}
\]

monmax  Monthly maximum
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \max \{ i(t', x), t_1 < t' \leq t_n \}
\]

monrange Monthly range
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{range} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monsum  Monthly sum
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \sum \{ i(t', x), t_1 < t' \leq t_n \}
\]

monmean Monthly mean
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{mean} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monavg  Monthly average
For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{avg} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monstd  Monthly standard deviation
Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{std} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monstd1 Monthly standard deviation (n-1)
Normalize by (n-1). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{std1} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monvar  Monthly variance
Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{var} \{ i(t', x), t_1 < t' \leq t_n \}
\]

monvar1 Monthly variance (n-1)
Normalize by (n-1). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same month it is:
\[
o(t, x) = \text{var1} \{ i(t', x), t_1 < t' \leq t_n \}
\]
Example

To compute the monthly mean of a time series use:

```
cdo monmean infile outfile
```

2.8.23. MONPCTL - Monthly percentile values

Synopsis

```
monpctl,p infile1 infile2 infile3 outfile
```

Description

This operator computes percentiles over all timesteps of the same month in `infile1`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable `CDO_PCTL_NBINS`. The files `infile2` and `infile3` should be the result of corresponding `monmin` and `monmax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be change with the `CDO` option `-timestat_date <first|middle|last>.

For every adjacent sequence $t_1, ..., t_n$ of timesteps of the same month it is:

\[
o(t,x) = \text{pth percentile}\{i(t',x), t_1 < t' \leq t_n\}
\]

Parameter

\[
p \quad \text{FLOAT} \quad \text{Percentile number in 0, ..., 100}
\]

Environment

`CDO_PCTL_NBINS`  Sets the number of histogram bins. The default number is 101.

Example

To compute the monthly 90th percentile of a time series use:

```
cdo monmin infile minfile
```

```
cdo monmax infile maxfile
```

```
cdo monpctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo monpctl,90 infile -monmin infile -monmax infile outfile
```
2.8.24. YEARMONSTAT - Yearly mean from monthly data

Synopsis

    yearmonmean infile outfile

Description

This operator computes the yearly mean of a monthly time series. Each month is weighted with the
number of days per month. The time of outfile is determined by the time in the middle of all
contributing timesteps of infile.

For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same year it is:

\[
o(t, x) = \text{mean}\{i(t', x), t_1 < t' \leq t_n\}
\]

Environment

    CDO_TIMESTAT_DATE      Sets the date information in outfile to the 'first', 'middle' or 'last' contributing timestep of infile.

Example

To compute the yearly mean of a monthly time series use:

    cdo yearmonmean infile outfile
2.8.25. YEARSTAT - Yearly statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values over timesteps of the same year. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of timesteps of the same year is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

yearmin Yearly minimum
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \min \{ i(t', x), t_1 < t' \leq t_n \}
\]

yearmax Yearly maximum
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \max \{ i(t', x), t_1 < t' \leq t_n \}
\]

yearminidx Yearly minimum indices
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \min\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearmaxidx Yearly maximum indices
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \max\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearrange Yearly range
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{range}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearsun Yearly sum
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{sum}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearmean Yearly mean
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{mean}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearavg Yearly average
For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{avg}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearstd Yearly standard deviation
Normalize by n. For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{std}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearstd1 Yearly standard deviation (n-1)
Normalize by (n-1). For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{std1}\{ i(t', x), t_1 < t' \leq t_n \}
\]

yearvar Yearly variance
Normalize by n. For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
\[
o(t, x) = \text{var}\{ i(t', x), t_1 < t' \leq t_n \}
\]
yearvar1 Yearly variance (n-1)
  Normalize by (n-1). For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:
  \[
o(t, x) = \text{var1}\{i(t', x), t_1 < t' \leq t_n\}
\]

**Note**

The operators yearmean and yearavg compute only arithmetical means!

**Example**

To compute the yearly mean of a time series use:

```
cdo yearmean infile outfile
```

To compute the yearly mean from the correct weighted monthly mean use:

```
cdo yearmonmean infile outfile
```

### 2.8.26. YEARPCTL - Yearly percentile values

**Synopsis**

```
yearpctl,p infile1 infile2 infile3 outfile
```

**Description**

This operator computes percentiles over all timesteps of the same year in `infile1`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable `CDO_PCTL_NBINS`. The files `infile2` and `infile3` should be the result of corresponding `yearmin` and `yearmax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be change with the `CDO` option 

`–timestat_date <first|middle|last>`. For every adjacent sequence \( t_1, \ldots, t_n \) of timesteps of the same year it is:

\[
o(t, x) = \text{pth percentile}\{i(t', x), t_1 < t' \leq t_n\}
\]

**Parameter**

- **p** FLOAT Percentile number in 0, ..., 100

**Environment**

- `CDO_PCTL_NBINS` Sets the number of histogram bins. The default number is 101.

**Example**

To compute the yearly 90th percentile of a time series use:

```
cdo yearmin infile minfile
cdo yearmax infile maxfile
cdo yearpctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo yearpctl,90 infile -yearmin infile -yearmax infile outfile
```

2.8.27. **SEASSTAT - Seasonal statistical values**

**Synopsis**

\[ \text{<operator> } \text{infile outfile} \]

**Description**

This module computes statistical values over timesteps of the same season. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of timesteps of the same season is written to outfile. The time of outfile is determined by the time in the middle of all contributing timesteps of infile. This can be change with the CDO option –timestat_date <first|middle|last>. Be careful about the first and the last output timestep, they may be incorrect values if the seasons have incomplete timesteps.

**Operators**

- **seasmin**  
  Seasonal minimum  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \min \{ i(t', x), t_1 < t' \leq t_n \} \]

- **seasmax**  
  Seasonal maximum  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \max \{ i(t', x), t_1 < t' \leq t_n \} \]

- **seasrange**  
  Seasonal range  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \( o(t, x) = \text{range}\{i(t', x), t_1 < t' \leq t_n\} \)

- **seassum**  
  Seasonal sum  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \sum \{ i(t', x), t_1 < t' \leq t_n \} \]

- **seasmean**  
  Seasonal mean  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{mean}\{i(t', x), t_1 < t' \leq t_n\} \]

- **seasavg**  
  Seasonal average  
  For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{avg}\{i(t', x), t_1 < t' \leq t_n\} \]

- **seasstd**  
  Seasonal standard deviation  
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{std}\{i(t', x), t_1 < t' \leq t_n\} \]

- **seasstd1**  
  Seasonal standard deviation \( (n-1) \)  
  Normalize by \( (n-1) \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{std1}\{i(t', x), t_1 < t' \leq t_n\} \]

- **seasvar**  
  Seasonal variance  
  Normalize by \( n \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{var}\{i(t', x), t_1 < t' \leq t_n\} \]

- **seasvar1**  
  Seasonal variance \( (n-1) \)  
  Normalize by \( (n-1) \). For every adjacent sequence \( t_1, ..., t_n \) of timesteps of the same season it is:  
  \[ o(t, x) = \text{var1}\{i(t', x), t_1 < t' \leq t_n\} \]
Example

To compute the seasonal mean of a time series use:

```
cdo seasmean infile outfile
```

2.8.28. SEASPCTL - Seasonal percentile values

Synopsis

```
seaspctl,p infile1 infile2 infile3 outfile
```

Description

This operator computes percentiles over all timesteps in `infile1` of the same season. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and ` infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by defining the environment variable `CDO_PCTL_NBINS`. The files ` infile2` and `infile3` should be the result of corresponding `seasmin` and `seasmax` operations, respectively. The time of `outfile` is determined by the time in the middle of all contributing timesteps of `infile1`. This can be change with the `CDO` option – `timestat_date <first|middle|last>`. Be careful about the first and the last output timestep, they may be incorrect values if the seasons have incomplete timesteps.

For every adjacent sequence `t_1,...,t_n` of timesteps of the same season it is:

\[ o(t, x) = pth \text{ percentile}\{i(t', x), t_1 < t' \leq t_n}\]  

Parameter

`p`  
**FLOAT**  
Percentile number in 0, ..., 100

Environment

`CDO_PCTL_NBINS`  
Sets the number of histogram bins. The default number is 101.

Example

To compute the seasonal 90th percentile of a time series use:

```
cdo seasmin infile minfile  
cdo seasmax infile maxfile  
cdo seaspctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo seaspctl,90 infile -seasmin infile -seasmax infile outfile
```
2.8.29. **YHOURSTAT** - Multi-year hourly statistical values

**Synopsis**

\(<\text{operator}>\) infile outfile

**Description**

This module computes statistical values of each hour and day of year. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of each hour and day of year in infile is written to outfile. The date information in an output field is the date of the last contributing input field.

**Operators**

- **yhourmin** Multi-year hourly minimum
  \[o(0001, x) = \min\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \min\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhourmax** Multi-year hourly maximum
  \[o(0001, x) = \max\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \max\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhourrange** Multi-year hourly range
  \[o(0001, x) = \text{range}\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \text{range}\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhoursum** Multi-year hourly sum
  \[o(0001, x) = \sum\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \sum\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhourmean** Multi-year hourly mean
  \[o(0001, x) = \text{mean}\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \text{mean}\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhouravg** Multi-year hourly average
  \[o(0001, x) = \text{avg}\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \text{avg}\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhourstd** Multi-year hourly standard deviation
  Normalize by n.
  \[o(0001, x) = \text{std}\{i(t, x), \text{day}(i(t)) = 0001\}\]
  \[
  \vdots
  \]
  \[o(8784, x) = \text{std}\{i(t, x), \text{day}(i(t)) = 8784\}\]

- **yhourstd1** Multi-year hourly standard deviation (n-1)
  Normalize by (n-1).
\[ o(0001, x) = \text{std1}\{i(t, x), \text{day}(i(t)) = 0001\} \]

\[ o(8784, x) = \text{std1}\{i(t, x), \text{day}(i(t)) = 8784\} \]

**yhourvar**

Multi-year hourly variance

Normalize by \( n \).

\[ o(0001, x) = \text{var}\{i(t, x), \text{day}(i(t)) = 0001\} \]

\[ o(8784, x) = \text{var}\{i(t, x), \text{day}(i(t)) = 8784\} \]

**yhourvar1**

Multi-year hourly variance (n-1)

Normalize by \((n-1)\).

\[ o(0001, x) = \text{var1}\{i(t, x), \text{day}(i(t)) = 0001\} \]

\[ o(8784, x) = \text{var1}\{i(t, x), \text{day}(i(t)) = 8784\} \]
2.8.30. DHOURSTAT - Multi-day hourly statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values of each hour of day. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of each hour of day in infile is written to outfile. The date information in an output field is the date of the last contributing input field.

2.8.31. YDAYSTAT - Multi-year daily statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values of each day of year. Depending on the chosen operator
the minimum, maximum, range, sum, average, variance or standard deviation of each day of year
in infile is written to outfile. The date information in an output field is the date of the last
contributing input field.

Operators

ydaymin  Multi-year daily minimum
o(001, x) = min\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = min\{i(t, x), \text{day}(i(t)) = 366\}

ydaymax  Multi-year daily maximum
o(001, x) = max\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = max\{i(t, x), \text{day}(i(t)) = 366\}

ydayrange Multi-year daily range
o(001, x) = range\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = range\{i(t, x), \text{day}(i(t)) = 366\}

ydaysum  Multi-year daily sum
o(001, x) = sum\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = sum\{i(t, x), \text{day}(i(t)) = 366\}

ydaymean Multi-year daily mean
o(001, x) = mean\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = mean\{i(t, x), \text{day}(i(t)) = 366\}

ydayavg  Multi-year daily average
o(001, x) = avg\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = avg\{i(t, x), \text{day}(i(t)) = 366\}

ydaystd  Multi-year daily standard deviation
Normalize by n.
o(001, x) = std\{i(t, x), \text{day}(i(t)) = 001\}
         :\n         o(366, x) = std\{i(t, x), \text{day}(i(t)) = 366\}

ydaystd1 Multi-year daily standard deviation (n-1)
Normalize by (n-1).
\[ o(001, x) = \text{std1}\{i(t, x), \text{day}(i(t)) = 001\} \]

\[ o(366, x) = \text{std1}\{i(t, x), \text{day}(i(t)) = 366\} \]

\textbf{ydayvar} \quad \text{Multi-year daily variance}

\textit{Normalize by n.}

\[ o(001, x) = \text{var}\{i(t, x), \text{day}(i(t)) = 001\} \]

\[ o(366, x) = \text{var}\{i(t, x), \text{day}(i(t)) = 366\} \]

\textbf{ydayvar1} \quad \text{Multi-year daily variance (n-1)}

\textit{Normalize by (n-1).}

\[ o(001, x) = \text{var1}\{i(t, x), \text{day}(i(t)) = 001\} \]

\[ o(366, x) = \text{var1}\{i(t, x), \text{day}(i(t)) = 366\} \]

\textbf{Example}

To compute the daily mean over all input years use:

\texttt{cdo ydaymean infile outfile}
2.8.32. **YDAYPCTL - Multi-year daily percentile values**

**Synopsis**

\[ \text{ydaypctl,} \ p \ \text{infile1} \ \text{infile2} \ \text{infile3} \ \text{outfile} \]

**Description**

This operator writes a certain percentile of each day of year in `infile1` to `outfile`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by setting the environment variable `CDO_PCTL_NBINS` to a different value. The files `infile2` and `infile3` should be the result of corresponding `ydaymin` and `ydaymax` operations, respectively. The date information in an output field is the date of the last contributing input field.

\[ o(001,x) = \text{pth percentile}\{i(t,x), \text{day}(i(t)) = 001\} \]

\[ o(366,x) = \text{pth percentile}\{i(t,x), \text{day}(i(t)) = 366\} \]

**Parameter**

\[ p \ \text{FLOAT} \quad \text{Percentile number in} \ 0, ..., 100 \]

**Environment**

\[ CDO_PCTL_NBINS \quad \text{Sets the number of histogram bins. The default number is 101.} \]

**Example**

To compute the daily 90th percentile over all input years use:

```
cdo ydaymin infile minfile
cdo ydaymax infile maxfile
cdo ydaypctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo ydaypctl,90 infile -ydaymin infile -ydaymax infile outfile
```
2.8.33. YMONSTAT - Multi-year monthly statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values of each month of year. Depending on the chosen operator
the minimum, maximum, range, sum, average, variance or standard deviation of each month of
year in infile is written to outfile. The date information in an output field is the date of the last
contributing input field. This can be change with the CDO option –timestat_date <first|middle|last>.

Operators

ymonmin Multi-year monthly minimum
\[ o(01, x) = \min\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \min\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonmax Multi-year monthly maximum
\[ o(01, x) = \max\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \max\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonrange Multi-year monthly range
\[ o(01, x) = \text{range}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \text{range}\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonsum Multi-year monthly sum
\[ o(01, x) = \text{sum}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \text{sum}\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonmean Multi-year monthly mean
\[ o(01, x) = \text{mean}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \text{mean}\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonavg Multi-year monthly average
\[ o(01, x) = \text{avg}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \text{avg}\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonstd Multi-year monthly standard deviation
Normalize by n.
\[ o(01, x) = \text{std}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ : \]
\[ o(12, x) = \text{std}\{i(t, x), \text{month}(i(t)) = 12\} \]

ymonstd1 Multi-year monthly standard deviation (n-1)
Normalize by (n-1).
\[ o(01, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ o(12, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 12\} \]

**ymonvar**

Multi-year monthly variance

Normalize by \( n \).

\[ o(01, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ o(12, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 12\} \]

**ymonvar1**

Multi-year monthly variance \((n-1)\)

Normalize by \((n-1)\).

\[ o(01, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 01\} \]
\[ o(12, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 12\} \]

**Example**

To compute the monthly mean over all input years use:

```
cdo ymonmean infile outfile
```
2.8.34. YMONPCTL - Multi-year monthly percentile values

Synopsis

```
ynonpctl,p infile1 infile2 infile3 outfile
```

Description

This operator writes a certain percentile of each month of year in `infile1` to `outfile`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by setting the environment variable `CDO_PCTL_NBINS` to a different value. The files `infile2` and `infile3` should be the result of corresponding `ymonmin` and `ymonmax` operations, respectively. The date information in an output field is the date of the last contributing input field.

\[
o(01, x) = p^\text{th} \text{ percentile}\{i(t, x), \text{month}(i(t)) = 01\}
\]

\[
; \quad
\]

\[
o(12, x) = p^\text{th} \text{ percentile}\{i(t, x), \text{month}(i(t)) = 12\}
\]

Parameter

- \(p\) FLOAT Percentile number in 0, ..., 100

Environment

- `CDO_PCTL_NBINS` Sets the number of histogram bins. The default number is 101.

Example

To compute the monthly 90th percentile over all input years use:

```
cdo ymonmin infile minfile
```

```
cdo ymonmax infile maxfile
```

```
cdo ymonpctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo ymonpctl,90 infile -ymonmin infile -ymonmax infile outfile
```
2.8.35. YSEASSTAT - Multi-year seasonal statistical values

Synopsis

<operator> infile outfile

Description

This module computes statistical values of each season. Depending on the chosen operator the minimum, maximum, range, sum, average, variance or standard deviation of each season in infile is written to outfile. The date information in an output field is the date of the last contributing input field.

Operators

yseasmin  Multi-year seasonal minimum
o(1, x) = \min\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \min\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \min\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \min\{i(t, x), month(i(t)) = 09, 10, 11\}

yseamax  Multi-year seasonal maximum
o(1, x) = \max\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \max\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \max\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \max\{i(t, x), month(i(t)) = 09, 10, 11\}

ysearange  Multi-year seasonal range
o(1, x) = \text{range}\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \text{range}\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \text{range}\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \text{range}\{i(t, x), month(i(t)) = 09, 10, 11\}

yseasum  Multi-year seasonal sum
o(1, x) = \text{sum}\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \text{sum}\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \text{sum}\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \text{sum}\{i(t, x), month(i(t)) = 09, 10, 11\}

yseasmean  Multi-year seasonal mean
o(1, x) = \text{mean}\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \text{mean}\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \text{mean}\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \text{mean}\{i(t, x), month(i(t)) = 09, 10, 11\}

yseavg  Multi-year seasonal average
o(1, x) = \text{avg}\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \text{avg}\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \text{avg}\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \text{avg}\{i(t, x), month(i(t)) = 09, 10, 11\}

yseasstd  Multi-year seasonal standard deviation
o(1, x) = \text{std}\{i(t, x), month(i(t)) = 12, 01, 02\}
o(2, x) = \text{std}\{i(t, x), month(i(t)) = 03, 04, 05\}
o(3, x) = \text{std}\{i(t, x), month(i(t)) = 06, 07, 08\}
o(4, x) = \text{std}\{i(t, x), month(i(t)) = 09, 10, 11\}
**yseasstd1**

Multi-year seasonal standard deviation (n-1)

\[ o(1, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 12, 01, 02}\]  
\[ o(2, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 03, 04, 05\} \]
\[ o(3, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 06, 07, 08\} \]
\[ o(4, x) = \text{std1}\{i(t, x), \text{month}(i(t)) = 09, 10, 11\} \]

**yseasvar**

Multi-year seasonal variance

\[ o(1, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 12, 01, 02\} \]
\[ o(2, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 03, 04, 05\} \]
\[ o(3, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 06, 07, 08\} \]
\[ o(4, x) = \text{var}\{i(t, x), \text{month}(i(t)) = 09, 10, 11\} \]

**yseasvar1**

Multi-year seasonal variance (n-1)

\[ o(1, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 12, 01, 02\} \]
\[ o(2, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 03, 04, 05\} \]
\[ o(3, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 06, 07, 08\} \]
\[ o(4, x) = \text{var1}\{i(t, x), \text{month}(i(t)) = 09, 10, 11\} \]

**Example**

To compute the seasonal mean over all input years use:

```
cdo yseasmean infile outfile
```
2.8.36. YSEASPCTL - Multi-year seasonal percentile values

Synopsis

```
yseaspctl, p infile1 infile2 infile3 outfile
```

Description

This operator writes a certain percentile of each season in `infile1` to `outfile`. The algorithm uses histograms with minimum and maximum bounds given in `infile2` and `infile3`, respectively. The default number of histogram bins is 101. The default can be overridden by setting the environment variable `CDO_PCTL_NBINS` to a different value. The files `infile2` and `infile3` should be the result of corresponding `yseasmin` and `yseasmax` operations, respectively. The date information in an output field is the date of the last contributing input field.

```
o(1,x) = \text{pth percentile}\{i(t,x), \text{month}(i(t)) = 12, 01, 02}\}
o(2,x) = \text{pth percentile}\{i(t,x), \text{month}(i(t)) = 03, 04, 05}\}
o(3,x) = \text{pth percentile}\{i(t,x), \text{month}(i(t)) = 06, 07, 08}\}
o(4,x) = \text{pth percentile}\{i(t,x), \text{month}(i(t)) = 09, 10, 11}\}
```

Parameter

```
p FLOAT Percentile number in 0, ..., 100
```

Environment

```
CDO_PCTL_NBINS Sets the number of histogram bins. The default number is 101.
```

Example

To compute the seasonal 90th percentile over all input years use:

```
cdo yseasmin infile minfile
cdo yseasmax infile maxfile
cdo yseaspctl,90 infile minfile maxfile outfile
```

Or shorter using operator piping:

```
cdo yseaspctl,90 infile -yseasmin infile -yseasmax infile outfile
```
2.8.37. **YDRUNSTAT - Multi-year daily running statistical values**

**Synopsis**

```
<operator>,nts infile outfile
```

**Description**

This module writes running statistical values for each day of year in `infile` to `outfile`. Depending on the chosen operator, the minimum, maximum, sum, average, variance or standard deviation of all timesteps in running windows of which the medium timestep corresponds to a certain day of year is computed. The date information in an output field is the date of the timestep in the middle of the last contributing running window. Note that the operator have to be applied to a continuous time series of daily measurements in order to yield physically meaningful results. Also note that the output time series begins \((nts-1)/2\) timesteps after the first timestep of the input time series and ends \((nts-1)/2\) timesteps before the last one. For input data which are complete but not continuous, such as time series of daily measurements for the same month or season within different years, the operator yields physically meaningful results only if the input time series does include the \((nts-1)/2\) days before and after each period of interest.

**Operators**

- **ydrunmin** Multi-year daily running minimum
  
  \[
  a(001, x) = \min \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \min \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]

- **ydrunmax** Multi-year daily running maximum
  
  \[
  a(001, x) = \max \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \max \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]

- **ydrunsum** Multi-year daily running sum
  
  \[
  a(001, x) = \sum \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \sum \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]

- **ydrunmean** Multi-year daily running mean
  
  \[
  a(001, x) = \text{mean} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \text{mean} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]

- **ydrunavg** Multi-year daily running average
  
  \[
  a(001, x) = \text{avg} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \text{avg} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]

- **ydrunstd** Multi-year daily running standard deviation
  
  Normalize by \(n\).
  
  \[
  a(001, x) = \text{std} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 001\} \\
  \vdots \\
  a(366, x) = \text{std} \{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); day[i(t + (nts - 1)/2)] = 366\}
  \]
**Statistical values**

**Reference manual**

**ydrunstd1**  
Multi-year daily running standard deviation (n-1)  
Normalize by (n-1).

\[
o(001, x) = \text{std1}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); \text{day}[(i(t + (nts - 1)/2)] = 001\}
\]

\[
... \text{for } i = 001, ..., 366.
\]

**ydrunvar**  
Multi-year daily running variance  
Normalize by n.

\[
o(001, x) = \text{var}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); \text{day}[(i(t + (nts - 1)/2)] = 001\}
\]

\[
... \text{for } i = 001, ..., 366.
\]

**ydrunvar1**  
Multi-year daily running variance (n-1)  
Normalize by (n-1).

\[
o(001, x) = \text{var1}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); \text{day}[(i(t + (nts - 1)/2)] = 001\}
\]

\[
... \text{for } i = 001, ..., 366.
\]

**Parameter**

nts  INTEGER  Number of timesteps

**Example**

Assume the input data provide a continuous time series of daily measurements. To compute the running multi-year daily mean over all input timesteps for a running window of five days use:

```
cdo ydrunmean,5 infile outfile
```

Note that except for the standard deviation the results of the operators in this module are equivalent to a composition of corresponding operators from the YDAYSTAT and RUNSTAT modules. For instance, the above command yields the same result as:

```
cdo ydaymean -runmean,5 infile outfile
```
2.8.38. YDRUNPCTL - Multi-year daily running percentile values

Synopsis

\texttt{ydrunpctl},p,nts \texttt{infile1 infile2 infile3 outfile}

Description

This operator writes running percentile values for each day of year in \texttt{infile1} to \texttt{outfile}. A certain percentile is computed for all timesteps in running windows of which the medium timestep corresponds to a certain day of year. The algorithm uses histograms with minimum and maximum bounds given in \texttt{infile2} and \texttt{infile3}, respectively. The default number of histogram bins is 101. The default can be overridden by setting the environment variable \texttt{CDO\_PCTL\_NBINS} to a different value. The files \texttt{infile2} and \texttt{infile3} should be the result of corresponding \texttt{ydrunmin} and \texttt{ydrunmax} operations, respectively. The date information in an output field is the date of the timestep in the middle of the last contributing running window. Note that the operator have to be applied to a continuous time series of daily measurements in order to yield physically meaningful results. Also note that the output time series begins \((nts-1)/2\) timesteps after the first timestep of the input time series and ends \((nts-1)/2\) timesteps before the last. For input data which are complete but not continuous, such as time series of daily measurements for the same month or season within different years, the operator only yields physically meaningful results if the input time series does include the \((nts-1)/2\) days before and after each period of interest.

\begin{align*}
o(001, x) &= \text{pth percentile}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); \text{day}[(i(t + (nts - 1)/2)] = 001\} \\
o(366, x) &= \text{pth percentile}\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x); \text{day}[(i(t + (nts - 1)/2)] = 366\}
\end{align*}

Parameter

\begin{itemize}
\item \texttt{p} FLOAT \hspace{1cm} \text{Percentile number in } 0, ..., 100
\item \texttt{nts} INTEGER \hspace{1cm} \text{Number of timesteps}
\end{itemize}

Environment

\texttt{CDO\_PCTL\_NBINS} \hspace{1cm} \text{Sets the number of histogram bins. The default number is 101.}

Example

Assume the input data provide a continuous time series of daily measurements. To compute the running multi-year daily 90th percentile over all input timesteps for a running window of five days use:

\begin{verbatim}
cdo ydrunmin,5 infile minfile
cdo ydrunmax,5 infile maxfile
cdo ydrunpctl,90,5 infile minfile maxfile outfile
\end{verbatim}

Or shorter using operator piping:

\begin{verbatim}
cdo ydrunpctl,90,5 infile -ydrunmin infile -ydrunmax infile outfile
\end{verbatim}
2.9. Correlation and co.

This section contains modules for correlation and co. in grid space and over time. In this section the abbreviations as in the following table are used:

<table>
<thead>
<tr>
<th>Covariance</th>
<th>$n^{-1} \sum_{i=1}^{n} (x_i - \bar{x})(y_i - \bar{y})$</th>
</tr>
</thead>
<tbody>
<tr>
<td>covar weighted by</td>
<td>$\left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{i=1}^{n} w_i \right) \left( x_i - \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{j=1}^{n} w_j x_j \right) \right) \left( y_i - \left( \sum_{j=1}^{n} w_j \right)^{-1} \left( \sum_{j=1}^{n} w_j y_j \right) \right)$</td>
</tr>
</tbody>
</table>

Here is a short overview of all operators in this section:

- **fldcor** Correlation in grid space
- **timcor** Correlation over time
- **fldcovar** Covariance in grid space
- **timcovar** Covariance over time
2.9.1. FLDCOR - Correlation in grid space

Synopsis

fldcor infile1 infile2 outfile

Description

The correlation coefficient is a quantity that gives the quality of a least squares fitting to the original data. This operator correlates all gridpoints of two fields for each timestep. With

\[ S(t) = \{x, i_1(t, x) \neq \text{missval} \land i_2(t, x) \neq \text{missval}\} \]

it is

\[ o(t, 1) = \frac{\sum_{x \in S(t)} i_1(t, x)i_2(t, x)w(x) - \bar{i}_1(t, x)\bar{i}_2(t, x)\sum_{x \in S(t)} w(x)}{\sqrt{\left(\sum_{x \in S(t)} i_1(t, x)^2w(x) - \bar{i}_1(t, x)^2\sum_{x \in S(t)} w(x)\right)\left(\sum_{x \in S(t)} i_2(t, x)^2w(x) - \bar{i}_2(t, x)^2\sum_{x \in S(t)} w(x)\right)}} \]

where \(w(x)\) are the area weights obtained by the input streams. For every timestep \(t\) only those field elements \(x\) belong to the sample, which have \(i_1(t, x) \neq \text{missval}\) and \(i_2(t, x) \neq \text{missval}\).

2.9.2. TIMCOR - Correlation over time

Synopsis

timcor infile1 infile2 outfile

Description

The correlation coefficient is a quantity that gives the quality of a least squares fitting to the original data. This operator correlates each gridpoint of two fields over all timesteps. With

\[ S(x) = \{t, i_1(t, x) \neq \text{missval} \land i_2(t, x) \neq \text{missval}\} \]

it is

\[ o(1, x) = \frac{\sum_{t \in S(x)} i_1(t, x)i_2(t, x) - n \bar{i}_1(t, x)\bar{i}_2(t, x)}{\sqrt{\left(\sum_{t \in S(x)} i_1(t, x)^2 - n \bar{i}_1(t, x)^2\right)\left(\sum_{t \in S(x)} i_2(t, x)^2 - n \bar{i}_2(t, x)^2\right)}} \]

For every gridpoint \(x\) only those timesteps \(t\) belong to the sample, which have \(i_1(t, x) \neq \text{missval}\) and \(i_2(t, x) \neq \text{missval}\).
2.9.3. FLDCOVAR - Covariance in grid space

Synopsis

`fldcovar infile1 infile2 outfile`

Description

This operator calculates the covariance of two fields over all gridpoints for each timestep. With

\[ S(t) = \{ x, i_1(t, x) \neq missval \land i_2(t, x) \neq missval \} \]

it is

\[ o(t, 1) = \left( \sum_{x \in S(t)} w(x) \right)^{-1} \sum_{x \in S(t)} w(x) \left( i_1(t, x) - \frac{\sum_{x \in S(t)} w(x) i_1(t, x)}{\sum_{x \in S(t)} w(x)} \right) \left( i_2(t, x) - \frac{\sum_{x \in S(t)} w(x) i_2(t, x)}{\sum_{x \in S(t)} w(x)} \right) \]

where \( w(x) \) are the area weights obtained by the input streams. For every timestep \( t \) only those field elements \( x \) belong to the sample, which have \( i_1(t, x) \neq missval \) and \( i_2(t, x) \neq missval \).

2.9.4. TIMCOVAR - Covariance over time

Synopsis

`timcovar infile1 infile2 outfile`

Description

This operator calculates the covariance of two fields at each gridpoint over all timesteps. With

\[ S(x) = \{ t, i_1(t, x) \neq missval \land i_2(t, x) \neq missval \} \]

it is

\[ o(1, x) = n^{-1} \sum_{t \in S(x)} (i_1(t, x) - \overline{i_1(t, x)})(i_2(t, x) - \overline{i_2(t, x)}) \]

For every gridpoint \( x \) only those timesteps \( t \) belong to the sample, which have \( i_1(t, x) \neq missval \) and \( i_2(t, x) \neq missval \).
2.10. Regression

This section contains modules for linear regression of time series.

Here is a short overview of all operators in this section:

- **regres**: Regression
- **detrend**: Detrend
- **trend**: Trend
- **addtrend**: Add trend
- **subtrend**: Subtract trend
2.10.1. REGRES - Regression

Synopsis

regres[,equal] infile outfile

Description

The values of the input file infile are assumed to be distributed as $N(a + bt, \sigma^2)$ with unknown $a$, $b$ and $\sigma^2$. This operator estimates the parameter $b$. For every field element $x$ only those timesteps $t$ belong to the sample $S(x)$, which have $i(t,x) \neq \text{miss}$. It is

$$o(1,x) = \sum_{t \in S(x)} \left( i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left( t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)$$

$$\sum_{t \in S(x)} \left( t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2$$

It is assumed that all timesteps are equidistant, if this is not the case set the parameter equal=false.

Parameter

equal  BOOL  Set to false for unequal distributed timesteps (default: true)

2.10.2. DETREND - Detrend time series

Synopsis

detrend[,equal] infile outfile

Description

Every time series in infile is linearly detrended. For every field element $x$ only those timesteps $t$ belong to the sample $S(x)$, which have $i(t,x) \neq \text{miss}$. It is assumed that all timesteps are equidistant, if this is not the case set the parameter equal=false. With

$$a(x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t,x) - b(x) \left( \frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$b(x) = \sum_{t \in S(x)} \left( i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left( t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)$$

$$\sum_{t \in S(x)} \left( t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2$$

it is

$$o(t,x) = i(t,x) - (a(x) + b(x)t)$$

Parameter

equal  BOOL  Set to false for unequal distributed timesteps (default: true)
Note
This operator has to keep the fields of all timesteps concurrently in the memory. If not enough memory is available use the operators trend and subtrend.

Example
To detrend the data in infile and to store the detrended data in outfile use:

```
cdo detrend infile outfile
```

2.10.3. TRENDS - Trend of time series

Synopsis

```
trend[.equal] infile outfile1 outfile2
```

Description

The values of the input file infile are assumed to be distributed as $N(a + bt, \sigma^2)$ with unknown $a$, $b$ and $\sigma^2$. This operator estimates the parameter $a$ and $b$. For every field element $x$ only those timesteps $t$ belong to the sample $S(x)$, which have $i(t, x) \neq \text{miss}$. It is

$$o_1(1, x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t, x) - b(x) \left( \frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$o_2(1, x) = \sum_{t \in S(x)} \left( i(t, x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t', x) \right) \left( t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)$$

Thus the estimation for $a$ is stored in outfile1 and that for $b$ is stored in outfile2. To subtract the trend from the data see operator subtrend. It is assumed that all timesteps are equidistant, if this is not the case set the parameter equal=false.

Parameter

```
equal    BOOL    Set to false for unequal distributed timesteps (default: true)
```

2.10.4. TRENDARITH - Add or subtract a trend

Synopsis

\[ \text{<operator>[,equal] infile1 infile2 infile3 outfile} \]

Description

This module is for adding or subtracting a trend computed by the operator trend.

Operators

- **addtrend** Add trend
  
  It is
  
  \[ o(t, x) = i_1(t, x) + (i_2(1, x) + i_3(1, x) \cdot t) \]

  where \( t \) is the timesteps.

- **subtrend** Subtract trend
  
  It is
  
  \[ o(t, x) = i_1(t, x) - (i_2(1, x) + i_3(1, x) \cdot t) \]

  where \( t \) is the timesteps.

Parameter

- **equal** BOOL Set to false for unequal distributed timesteps (default: true)

Example

The typical call for detrending the data in infile and storing the detrended data in outfile is:

```bash
  cdo trend infile afile bfile
  cdo subtrend infile afile bfile outfile
```

The result is identical to a call of the operator **detrend**:

```bash
  cdo detrend infile outfile
```
2.11. EOFs

This section contains modules to compute Empirical Orthogonal Functions and - once they are computed - their principal coefficients.

An introduction to the theory of principal component analysis as applied here can be found in:
Principal Component Analysis in Meteorology and Oceanography [Preisendorfer]
Details about calculation in the time- and spatial spaces are found in:
Statistical Analysis in Climate Research [vonStorch]

EOFs are defined as the eigen values of the scatter matrix (covariance matrix) of the data. For the sake of simplicity, samples are regarded as time series of anomalies \((z(t)), t \in \{1, \ldots, n\}\) of (column-) vectors \(z(t)\) with \(p\) entries (where \(p\) is the gridsize). Thus, using the fact, that \(z_j(t)\) are anomalies, i.e.

\[
\langle z_j \rangle = n^{-1} \sum_{i=1}^{n} z_j(i) = 0 \quad \forall \quad 1 \leq j \leq p
\]

the scatter matrix \(S\) can be written as

\[
S = \sum_{t=1}^{n} \left[ \sqrt{W} z(t) \right] \left[ \sqrt{W} z(t) \right]^T
\]

where \(W\) is the diagonal matrix containing the area weight of cell \(p_0\) in \(z\) at \(W(x,x)\).

The matrix \(S\) has a set of orthonormal eigenvectors \(e_j, j = 1, \ldots, p\), which are called empirical orthogonal functions (EOFs) of the sample \(z\). (Please note, that \(e_j\) is the eigenvector of \(S\) and not the weighted eigenvector which would be \(W e_j\).) Let the corresponding eigenvalues be denoted \(\lambda_j\). The vectors \(e_j\) are spatial patterns which explain a certain amount of variance of the time series \(z(t)\) that is related linearly to \(\lambda_j\). Thus, the spatial pattern defined by the first eigenvector (the one with the largest eigenvalue ) is the pattern which explains a maximum possible amount of variance of the sample \(z(t)\). The orthonormality of eigenvectors reads as

\[
\sum_{x=1}^{p} \left[ \sqrt{W(x,x)} e_j(x) \right] \left[ \sqrt{W(x,x)} e_k(x) \right] = \sum_{x=1}^{p} W(x,x) e_j(x) e_k(x) = \begin{cases} 0 \text{ if } j \neq k \\ 1 \text{ if } j = k \end{cases}
\]

If all EOFs \(e_j\) with \(\lambda_j \neq 0\) are calculated, the data can be reconstructed from

\[
z(t, x) = \sum_{j=1}^{p} W(x,x) a_j(t) e_j(x)
\]

where \(a_j\) are called the principal components or principal coefficients or EOF coefficients of \(z\). These coefficients - as readily seen from above - are calculated as the projection of an EOF \(e_j\) onto a time step of the data sample \(z(t_0)\) as

\[
a_j(t_0) = \sum_{x=1}^{p} \left[ \sqrt{W(x,x)} e_j(x) \right] \left[ \sqrt{W(x,x)} z(t_0, x) \right] = \left[ \sqrt{W} z(t_0) \right]^T \left[ \sqrt{W} e_j \right].
\]

Here is a short overview of all operators in this section:

- `eof` Calculate EOFs in spatial or time space
- `eoftime` Calculate EOFs in time space
- `eofspatial` Calculate EOFs in spatial space
- `eof3d` Calculate 3-Dimensional EOFs in time space
- `eofcoeff` Calculate principal coefficients of EOFs
2.11.1. EOFs - Empirical Orthogonal Functions

Synopsis

<operator>,neof infile outfile1 outfile2

Description

This module calculates empirical orthogonal functions of the data in infile as the eigen values of the scatter matrix (covariance matrix) $\mathbf{S}$ of the data sample $z(t)$. A more detailed description can be found above.

Please note, that the input data are assumed to be anomalies.

If operator eof is chosen, the EOFs are computed in either time or spatial space, whichever is the fastest. If the user already knows, which computation is faster, the module can be forced to perform a computation in time- or gridspace by using the operators eoftime or eofspatial, respectively. This can enhance performance, especially for very long time series, where the number of timesteps is larger than the number of grid-points. Data in infile are assumed to be anomalies. If they are not, the behavior of this module is not well defined. After execution outfile1 will contain all eigen-values and outfile2 the eigenvectors $e_j$. All EOFs and eigen-values are computed. However, only the first neof EOFs are written to outfile2. Nonetheless, outfile1 contains all eigen-values.

Missing values are not fully supported. Support is only checked for non-changing masks of missing values in time. Although there still will be results, they are not trustworthy, and a warning will occur. In the latter case we suggest to replace missing values by 0 in infile.

Operators

- **eof** Calculate EOFs in spatial or time space
- **eoftime** Calculate EOFs in time space
- **eofspatial** Calculate EOFs in spatial space
- **eof3d** Calculate 3-Dimensional EOFs in time space

Parameter

- **neof** INTEGER Number of eigen functions

Environment

- **CDO_SVD_MODE** Is used to choose the algorithm for eigenvalue calculation. Options are 'jacobi' for a one-sided parallel jacobi-algorithm (only executed in parallel if -P flag is set) and 'danielson_lanczos' for a non-parallel d/l algorithm. The default setting is 'jacobi'.
- **CDO_WEIGHT_MODE** It is used to set the weight mode. The default is 'off'. Set it to 'on' for a weighted version.
- **MAX_JACOBI_ITER** Is the maximum integer number of annihilation sweeps that is executed if the jacobi-algorithm is used to compute the eigen values. The default value is 12.
- **FNORM_PRECISION** Is the Frobenius norm of the matrix consisting of an annihilation pair of eigenvectors that is used to determine if the eigenvectors have reached a sufficient level of convergence. If all annihilation-pairs of vectors have a norm below this value, the computation is considered to have converged properly. Otherwise, a warning will occur. The default value 1e-12.
Example

To calculate the first 40 EOFs of a data-set containing anomalies use:

```
cdo eof,40 infile outfile1 outfile2
```

If the dataset does not contain anomalies, process them first, and use:

```
cdo sub infile1 -timmean infile1 anom_file
cdo eof,40 anom_file outfile1 outfile2
```
2.11.2. EOFCOEFF - Principal coefficients of EOFs

Synopsis

eofcoeff infile1 infile2 obase

Description

This module calculates the time series of the principal coefficients for given EOF (empirical orthogonal functions) and data. Time steps in infile1 are assumed to be the EOFs, time steps in infile2 are assumed to be the time series. Note, that this operator calculates a non weighted dot product of the fields in infile1 and infile2. For consistency set the environment variable CDO_WEIGHT_MODE=off when using eof or eof3d. Given a set of EOFs $e_j$ and a time series of data $z(t)$ with $p$ entries for each timestep from which $e_j$ have been calculated, this operator calculates the time series of the projections of data onto each EOF

$$o_j(t) = \sum_{x=1}^{p} z(t,x)e_j(x)$$

There will be a separate file $o_j$ for the principal coefficients of each EOF.

As the EOFs $e_j$ are uncorrelated, so are their principal coefficients, i.e.

$$\sum_{t=1}^{n} o_j(t)o_k(t) = \begin{cases} 0 & \text{if } j \neq k \\ \lambda_j & \text{if } j = k \end{cases} \quad \text{with} \quad \sum_{t=1}^{n} o_j(t) = 0 \forall j \in \{1,\ldots,p\}.$$  

There will be a separate file containing a time series of principal coefficients with time information from infile2 for each EOF in infile1. Output files will be numbered as <obase><neof><suffix> where neof+1 is the number of the EOF (timestep) in infile1 and suffix is the filename extension derived from the file format.

Environment

CDO_FILE_SUFFIX Set the default file suffix. This suffix will be added to the output file names instead of the filename extension derived from the file format. Set this variable to NULL to disable the adding of a file suffix.

Example

To calculate principal coefficients of the first 40 EOFs of anom_file, and write them to files beginning with obase, use:

```plaintext
export CDO_WEIGHT_MODE=off
cdo eof,40 anom_file eval_file eof_file
cdo eofcoeff eof_file anom_file obase
```

The principal coefficients of the first EOF will be in the file obase000000.nc (and so forth for higher EOFs, nth EOF will be in obase<n-1>.)

If the dataset infile does not contain anomalies, process them first, and use:

```plaintext
export CDO_WEIGHT_MODE=off
cdo sub infile -timmean infile anom_file
cdo eof,40 anom_file eval_file eof_file
cdo eofcoeff eof_file anom_file obase
```
2.12. Interpolation

This section contains modules to interpolate datasets. There are several operators to interpolate horizontal fields to a new grid. Some of those operators can handle only 2D fields on a regular rectangular grid. Vertical interpolation of 3D variables is possible from hybrid model levels to height or pressure levels. Interpolation in time is possible between time steps and years.

Here is a short overview of all operators in this section:

- **remapbil**: Bilinear interpolation
- **genbil**: Generate bilinear interpolation weights
- **remapbic**: Bicubic interpolation
- **genbic**: Generate bicubic interpolation weights
- **remapnn**: Nearest neighbor remapping
- **gennn**: Generate nearest neighbor remap weights
- **remapdis**: Distance weighted average remapping
- **gendis**: Generate distance weighted average remap weights
- **remapcon**: First order conservative remapping
- **gencon**: Generate 1st order conservative remap weights
- **remapcon2**: Second order conservative remapping
- **gencon2**: Generate 2nd order conservative remap weights
- **remaplaf**: Largest area fraction remapping
- **genlaf**: Generate largest area fraction remap weights
- **remap**: Grid remapping
- **remapeta**: Remap vertical hybrid level
- **ml2pl**: Model to pressure level interpolation
- **ml2hl**: Model to height level interpolation
- **ap2pl**: Air pressure to pressure level interpolation
- **gh2hl**: Geometric height to height level interpolation
- **intlevel**: Linear level interpolation
- **intlevel3d**: Linear level interpolation onto a 3D vertical coordinate
- **intlevelx3d**: Like intlevel3d but with extrapolation
- **isosurface**: Extract isosurface data
- **inttime**: Interpolation between timesteps
- **intntime**: Interpolation between timesteps
- **intyear**: Interpolation between two years
2.12.1. REMAPBIL - Bilinear interpolation

Synopsis

\[ <\text{operator}>, \text{grid} \ \text{infile} \ \text{outfile} \]

Description

This module contains operators for a bilinear remapping of fields between grids in spherical coordinates. The interpolation is based on an adapted SCRIP library version. For a detailed description of the interpolation method see [SCRIP]. This interpolation method only works on quadrilateral curvilinear source grids. Below is a schematic illustration of the bilinear remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

remapbil  Bilinear interpolation
Performs a bilinear interpolation on all input fields.
genbil  Generate bilinear interpolation weights
Generates bilinear interpolation weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

grid  STRING  Target grid description file or name

Environment

REMAP_EXTRAPOLATE  This variable is used to switch the extrapolation feature ‘on’ or ‘off’. By default the extrapolation is enabled for circular grids.

Example

Say \text{infile} contains fields on a quadrilateral curvilinear grid. To remap all fields bilinear to a Gaussian N32 grid, type:

\[ \text{cdo remapbil,n32 infile outfile} \]
2.12.2. REMAPBIC - Bicubic interpolation

Synopsis

<operator>.grid infile outfile

Description

This module contains operators for a bicubic remapping of fields between grids in spherical coordinates. The interpolation is based on an adapted SCRIP library version. For a detailed description of the interpolation method see [SCRIP]. This interpolation method only works on quadrilateral curvilinear source grids. Below is a schematic illustration of the bicubic remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

- **remapbic**: Bicubic interpolation
  Performs a bicubic interpolation on all input fields.

- **genbic**: Generate bicubic interpolation weights
  Generates bicubic interpolation weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

- **grid**: STRING
  Target grid description file or name

Environment

- **REMAP_EXTRAPOLATE**: This variable is used to switch the extrapolation feature 'on' or 'off'. By default the extrapolation is enabled for circular grids.

Example

Say **infile** contains fields on a quadrilateral curvilinear grid. To remap all fields bicubic to a Gaussian N32 grid, type:

```bash
cdo remapbic,n32 infile outfile
```
2.12.3. REMAPNN - Nearest neighbor remapping

Synopsis

\[ <\text{operator}> . \text{grid} \ \text{infile} \ \text{outfile} \]

Description

This module contains operators for a nearest neighbor remapping of fields between grids in spherical coordinates. Below is a schematic illustration of the nearest neighbor remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

-remapnn Nearest neighbor remapping
-Generates nearest neighbor remapping weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention.
-Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

-grid STRING Target grid description file or name

Environment

-REMAP_EXTRAPOLATE This variable is used to switch the extrapolation feature 'on' or 'off'. By default the extrapolation is enabled for this remapping method.
-CDO_GRIDSEARCH_RADIUS Grid search radius in degree, default 180 degree.
2.12.4. REMAPDIS - Distance weighted average remapping

Synopsis

\texttt{remapdis.grid[,neighbors] infile outfile}

\texttt{gendis.grid infile outfile}

Description

This module contains operators for an inverse distance weighted average remapping of the four nearest neighbor values of fields between grids in spherical coordinates. The interpolation is based on an adapted SCRIP library version. For a detailed description of the interpolation method see [SCRIP]. Below is a schematic illustration of the distance weighted average remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

\texttt{remapdis} \hspace{1em} Distance weighted average remapping

Performs an inverse distance weighted average remapping of the nearest neighbors value on all input fields. The default number of nearest neighbors is 4.

\texttt{gendis} \hspace{1em} Generate distance weighted average remap weights

Generates distance weighted average remapping weights of the four nearest neighbor values for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator \texttt{remap} to apply this remapping weights to a data file with the same source grid.

Parameter

\texttt{grid} \hspace{1em} STRING \hspace{1em} Target grid description file or name

\texttt{neighbors} \hspace{1em} INTEGER \hspace{1em} Number of nearest neighbors

Environment

\texttt{REMAP_EXTRAPOLATE} \hspace{1em} This variable is used to switch the extrapolation feature 'on' or 'off'. By default the extrapolation is enabled for this remapping method.

\texttt{CDO_GRIDSEARCH_RADIUS} \hspace{1em} Grid search radius in degree, default 180 degree.
2.12.5. REMAPCON - First order conservative remapping

Synopsis

<operator>,grid infile outfile

Description

This module contains operators for a first order conservative remapping of fields between grids in spherical coordinates. The operators in this module uses code from the YAC software package to compute the conservative remapping weights. For a detailed description of the interpolation method see [YAC]. The interpolation method is completely general and can be used for any grid on a sphere. The search algorithm for the conservative remapping requires that no grid cell occurs more than once. Below is a schematic illustration of the 1st order conservative remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

remapcon First order conservative remapping
Performs a first order conservative remapping on all input fields.

gencon Generate 1st order conservative remap weights
Generates first order conservative remapping weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

grid STRING Target grid description file or name

Environment

CDO_REMAP_NORM This variable is used to choose the normalization of the conservative interpolation. By default CDO_REMAP_NORM is set to 'fracarea'. 'fracarea' uses the sum of the non-masked source cell intersected areas to normalize each target cell field value. This results in a reasonable flux value but the flux is not locally conserved. The option 'destarea' uses the total target cell area to normalize each target cell field value. Local flux conservation is ensured, but unreasonable flux values may result.
REMAP_AREA_MIN  This variable is used to set the minimum destination area fraction. The default of this variable is 0.0.

**Example**

Say `infile` contains fields on a quadrilateral curvilinear grid. To remap all fields conservative to a Gaussian N32 grid, type:

```
cdo remapcon,n32 infile outfile
```
2.12.6. REMAPCON2 - Second order conservative remapping

Synopsis

<operator>.grid infile outfile

Description

This module contains operators for a second order conservative remapping of fields between grids in spherical coordinates. The interpolation is based on an adapted SCRIP library version. For a detailed description of the interpolation method see [SCRIP]. The interpolation method is completely general and can be used for any grid on a sphere. The search algorithm for the conservative remapping requires that no grid cell occurs more than once. Below is a schematic illustration of the 2nd order conservative remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

remapcon2   Second order conservative remapping
Performs a second order conservative remapping on all input fields.

gencon2     Generate 2nd order conservative remap weights
Generates second order conservative remapping weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

grid    STRING    Target grid description file or name

Environment

CDO_REMAP_NORM   This variable is used to choose the normalization of the conservative interpolation. By default CDO_REMAP_NORM is set to 'fracarea'. 'fracarea' uses the sum of the non-masked source cell intersected areas to normalize each target cell field value. This results in a reasonable flux value but the flux is not locally conserved. The option 'destarea' uses the total target cell area to normalize each target cell field value. Local flux conservation is ensured, but unreasonable flux values may result.
REMAP_AREA_MIN  This variable is used to set the minimum destination area fraction. The default of this variable is 0.0.

**Note**

The SCRIP conservative remapping method doesn’t work correctly for some grid combinations.

**Example**

Say `infile` contains fields on a quadrilateral curvilinear grid. To remap all fields conservative (2nd order) to a Gaussian N32 grid, type:

```
cdo remapcon2,n32 infile outfile
```
2.12.7. REMAPLAF - Largest area fraction remapping

Synopsis

<operator>,grid infile outfile

Description

This module contains operators for a largest area fraction remapping of fields between grids in spherical coordinates. The operators in this module uses code from the YAC software package to compute the largest area fraction. For a detailed description of the interpolation method see [YAC]. The interpolation method is completely general and can be used for any grid on a sphere. The search algorithm for this remapping method requires that no grid cell occurs more than once. Below is a schematic illustration of the largest area fraction conservative remapping:

The figure on the left side shows the input data on a regular lon/lat source grid and on the right side the remapped result on an unstructured triangular target grid. The figure in the middle shows the input data with the target grid. Grid cells with missing value are grey colored.

Operators

remaplf Largest area fraction remapping
Performs a largest area fraction remapping on all input fields.

genlf Generate largest area fraction remap weights
Generates largest area fraction remapping weights for the first input field and writes the result to a file. The format of this file is NetCDF following the SCRIP convention. Use the operator remap to apply this remapping weights to a data file with the same source grid.

Parameter

grid STRING Target grid description file or name

Environment

REMAP_AREA_MIN This variable is used to set the minimum destination area fraction. The default of this variable is 0.0.
2.12.8. REMAP - Grid remapping

Synopsis

```
remap,grid,weights infile outfile
```

Description

Interpolation between different horizontal grids can be a very time-consuming process. Especially if
the data are on an unstructured and/or a large grid. In this case the interpolation process can be split
into two parts. Firstly the generation of the interpolation weights, which is the most time-consuming
part. These interpolation weights can be reused for every remapping process with the operator `remap`.
This operator remaps all input fields to a new horizontal grid. The remap type and the interpolation
weights of one input grid are read from a NetCDF file. More weights are computed if the input
fields are on different grids. The NetCDF file with the weights should follow the `[SCRIP]` convention.
Normally these weights come from a previous call to one of the genXXX operators (e.g. `genbil`) or
were created by the original SCRIP package.

Parameter

- `grid` STRING Target grid description file or name
- `weights` STRING Interpolation weights (SCRIP NetCDF file)

Environment

- `CDO_REMAP_NORM` This variable is used to choose the normalization of the conservative
  interpolation. By default `CDO_REMAP_NORM` is set to `fracarea`. `fracarea` uses the sum of the non-masked source cell intersected areas to normalize each target cell field value. This results in a reasonable flux value but the flux is not locally conserved. The option `destarea` uses the total target cell area to normalize each target cell field value. Local flux conservation is ensured, but unreasonable flux values may result.
- `REMAP_EXTRAPOLATE` This variable is used to switch the extrapolation feature 'on' or 'off'. By default the extrapolation is enabled for remapdis, remapnn and for circular grids.
- `REMAP_AREA_MIN` This variable is used to set the minimum destination area fraction. The default of this variable is 0.0.
- `CDO_GRIDSEARCH_RADIUS` Grid search radius in degree, default 180 degree.

Example

Say `infile` contains fields on a quadrilateral curvilinear grid. To remap all fields bilinear to a Gaussian
N32 grid use:

```
cdo genbil,n32 infile remapweights.nc
cdo remap,n32,remapweights.nc infile outfile
```

The result will be the same as:

```
cdo remapbil,n32 infile outfile
```
2.12.9. REMAPETA - Remap vertical hybrid level

Synopsis

```
remapeta.vct,.oro/ infile outfile
```

Description

This operator interpolates between different vertical hybrid levels. This include the preparation of consistent data for the free atmosphere. The procedure for the vertical interpolation is based on the HIRLAM scheme and was adapted from [INTERA]. The vertical interpolation is based on the vertical integration of the hydrostatic equation with few adjustments. The basic tasks are the following one:

- at first integration of hydrostatic equation
- extrapolation of surface pressure
- Planetary Boundary-Layer (PBL) proutfile interpolation
- interpolation in free atmosphere
- merging of both proutfiles
- final surface pressure correction

The vertical interpolation corrects the surface pressure. This is simply a cut-off or an addition of air mass. This mass correction should not influence the geostrophic velocity field in the middle troposphere. Therefore the total mass above a given reference level is conserved. As reference level the geopotential height of the 400 hPa level is used. Near the surface the correction can affect the vertical structure of the PBL. Therefore the interpolation is done using the potential temperature. But in the free atmosphere above a certain n (n=0.8 defining the top of the PBL) the interpolation is done linearly. After the interpolation both proutfiles are merged. With the resulting temperature/pressure correction the hydrostatic equation is integrated again and adjusted to the reference level finding the final surface pressure correction. A more detailed description of the interpolation can be found in [INTERA]. This operator requires all variables on the same horizontal grid.

Parameter

- `vct` STRING File name of an ASCII dataset with the vertical coordinate table
- `oro` STRING File name with the orography (surf. geopotential) of the target dataset (optional)

Environment

- `REMAPETA_PTOP` Sets the minimum pressure level for condensation. Above this level the humidity is set to the constant 1.E-6. The default value is 0 Pa.

Note

The code numbers or the variable names of the required parameter have to follow the [ECHAM] convention.

Use the `sinfo` command to test if your vertical coordinate system is recognized as hybrid system.

In case `remapeta` complains about not finding any data on hybrid model levels you may wish to use the `setzaxis` command to generate a zaxis description which conforms to the ECHAM convention. See section "1.4 Z-axis description" for an example how to define a hybrid Z-axis.
Example

To remap between different hybrid model level data use:

```
cdo remapeta,vct infile outfile
```

Here is an example vct file with 19 hybrid model level:

2.12.10. VERTINTML - Vertical interpolation

Synopsis

\[ \text{ml2pl,plevels} \text{ infile outfile} \]
\[ \text{ml2hl,hlevels} \text{ infile outfile} \]

Description

Interpolates 3D variables on hybrid sigma pressure level to pressure or height levels. The input file should contain the log. surface pressure or the surface pressure. To extrapolate the temperature, the surface geopotential is also needed. It is assumed that the geopotential heights are located on the hybrid layer interfaces. For the lowest layer of geopotential heights the surface geopotential is required. The pressure, temperature, geopotential height, and surface geopotential are identified by their GRIB1 code number or NetCDF CF standard name. Supported parameter tables are: WMO standard table number 2 and ECMWF local table number 128.

Use the alias \text{ml2plx/ml2hlx} or the environment variable \text{EXTRAPOLATE} to extrapolate missing values. This operator requires all variables on the same horizontal grid. Missing values in the input data are not supported.

Operators

\text{ml2pl} \quad \text{Model to pressure level interpolation}
Interpolates 3D variables on hybrid sigma pressure level to pressure level.

\text{ml2hl} \quad \text{Model to height level interpolation}
Interpolates 3D variables on hybrid sigma pressure level to height level. The procedure is the same as for the operator \text{ml2pl} except for the pressure levels being calculated from the heights by: \[ plevel = 101325 \times \exp(hlevel/ - 7000) \]

Parameter

\[ \text{plevels} \quad \text{FLOAT} \quad \text{Pressure levels in pascal} \]
\[ \text{hlevels} \quad \text{FLOAT} \quad \text{Height levels in meter} \]

Environment

\text{EXTRAPOLATE} \quad \text{If set to 1 extrapolate missing values.}

Example

To interpolate hybrid model level data to pressure levels of 925, 850, 500 and 200 hPa use:

\begin{verbatim}
cdo ml2pl,92500,85000,50000,20000 infile outfile
\end{verbatim}
2.12.11. VERTINTAP - Vertical pressure interpolation

Synopsis

```
ap2pl,plevels  infile  outfile
```

Description

Interpolate 3D variables on hybrid sigma height coordinates to pressure levels. The input file must contain the 3D air pressure in pascal. The air pressure is identified by the NetCDF CF standard name `air_pressure`. Use the alias `ap2plx` or the environment variable `EXTRAPOLATE` to extrapolate missing values. This operator requires all variables on the same horizontal grid.

Parameter

```
plevels  FLOAT  Comma-separated list of pressure levels in pascal
```

Environment

```
EXTRAPOLATE  If set to 1 extrapolate missing values.
```

Note

This is a specific implementation for NetCDF files from the ICON model, it may not work with data from other sources.

Example

To interpolate 3D variables on hybrid sigma height level to pressure levels of 925, 850, 500 and 200 hPa use:

```
cdo ap2pl,92500,85000,50000,20000  infile  outfile
```
2.12.12. VERTINTGH - Vertical height interpolation

Synopsis

\( gh2hl, hlevels \) infile outfile

Description

Interpolate 3D variables on hybrid sigma height coordinates to height levels. The input file must contain the 3D geometric height in meter. The geometric height is identified by the NetCDF CF standard name \texttt{geometric\_height\_at\_full\_level\_center}. Use the alias \texttt{gh2hlx} or the environment variable \texttt{EXTRAPOLATE} to extrapolate missing values. This operator requires all variables on the same horizontal grid.

Parameter

\texttt{hlevels} FLOAT Comma-separated list of height levels in meter

Environment

\texttt{EXTRAPOLATE} If set to 1 extrapolate missing values.

Note

This is a specific implementation for NetCDF files from the ICON model, it may not work with data from other sources.

Example

To interpolate 3D variables on hybrid sigma height level to height levels of 20, 100, 500, 1000, 5000, 10000 and 20000 meter use:

\begin{verbatim}
cdo gh2hl,20,100,500,1000,5000,10000,20000 infile outfile
\end{verbatim}
2.12.13. INTLEVEL - Linear level interpolation

Synopsis

\texttt{intlevel,\texttt{levels} infile outfile}

Description

This operator performs a linear vertical interpolation of 3D variables.

Parameter

\texttt{levels} FLOAT Comma-separated list of target levels

Example

To interpolate 3D variables on height levels to a new set of height levels use:

\texttt{cdo intlevel,10,50,100,500,1000 infile outfile}

2.12.14. INTLEVEL3D - Linear level interpolation from/to 3D vertical coordinates

Synopsis

\texttt{<operator>,tgtcoordinate infile1 infile2 outfile}

Description

This operator performs a linear vertical interpolation of 3D variables fields with given 3D vertical coordinates. \texttt{infile1} contains the 3D data variables and \texttt{infile2} the 3D vertical source coordinate. The parameter \texttt{tgtcoordinate} is a datafile with the 3D vertical target coordinate.

Operators

\texttt{intlevel3d} Linear level interpolation onto a 3D vertical coordinate

\texttt{intlevelx3d} like \texttt{intlevel3d} but with extrapolation

Parameter

\texttt{tgtcoordinate} STRING filename for 3D vertical target coordinates

Example

To interpolate 3D variables from one set of 3D height levels into another one where

\begin{itemize}
  \item \texttt{infile2} contains a single 3D variable, which represents the source 3D vertical coordinate
  \item \texttt{infile1} contains the source data, which the vertical coordinate from \texttt{infile2} belongs to
  \item \texttt{tgtcoordinate} only contains the target 3D height levels
\end{itemize}

\texttt{cdo intlevel3d,tgtcoordinate infile1 infile2 outfile}
2.12.15. ISOSURFACE - Extract isosurface

Synopsis

\texttt{isosurface, isovalue \ infile \ outfile}

Description

This operator computes isosurface data from all 3D variables at the isosurface value specified in \texttt{isovalue}. The isosurface is calculated by linear interpolation between two layers. The result is a horizontal 2D field.

Parameter

\texttt{isovalue} \quad \texttt{FLOAT} \quad \texttt{Isosurface value}
2.12.16. INTTIME - Time interpolation

Synopsis

\texttt{inttime, date, time[, inc]}  \texttt{inile outfile}
\texttt{intntime, n  inile outfile}

Description

This module performs linear interpolation between timesteps.

Operators

\begin{itemize}
  \item \texttt{inttime} \hspace{1cm} Interpolation between timesteps
  \hspace{1cm} This operator creates a new dataset by linear interpolation between timesteps. The user has to define the start date/time with an optional increment.
  \item \texttt{intntime} \hspace{1cm} Interpolation between timesteps
  \hspace{1cm} This operator performs linear interpolation between timesteps. The user has to define the number of timesteps from one timestep to the next.
\end{itemize}

Parameter

\begin{itemize}
  \item \texttt{date} \hspace{1cm} STRING \hspace{1cm} Start date (format YYYY-MM-DD)
  \item \texttt{time} \hspace{1cm} STRING \hspace{1cm} Start time (format hh:mm:ss)
  \item \texttt{inc} \hspace{1cm} STRING \hspace{1cm} Optional increment (seconds, minutes, hours, days, months, years) [default: 0hour]
  \item \texttt{n} \hspace{1cm} INTEGER \hspace{1cm} Number of timesteps from one timestep to the next
\end{itemize}

Example

Assumed a 6 hourly dataset starts at 1987-01-01 12:00:00. To interpolate this time series to a one hourly dataset use:

\begin{verbatim}
cdo inttime,1987-01-01,12:00:00,1hour inile outfile
\end{verbatim}
2.12.17. INTYEAR - Year interpolation

Synopsis

\texttt{intyear,years infile1 infile2 obase}

Description

This operator performs linear interpolation between two years, timestep by timestep. The input files need to have the same structure with the same variables. The output files will be named \texttt{<obase><yyyy><suffix>} where \texttt{yyyy} will be the year and \texttt{suffix} is the filename extension derived from the file format.

Parameter

\texttt{years INTEGER} Comma-separated list or first/last[/inc] range of years

Environment

\texttt{CDO\_FILE\_SUFFIX} Set the default file suffix. This suffix will be added to the output file names instead of the filename extension derived from the file format. Set this variable to \texttt{NULL} to disable the adding of a file suffix.

Note

This operator needs to open all output files simultaneously. The maximum number of open files depends on the operating system!

Example

Assume there are two monthly mean datasets over a year. The first dataset has 12 timesteps for the year 1985 and the second one for the year 1990. To interpolate the years between 1985 and 1990 month by month use:

\begin{verbatim}
\end{verbatim}

Example result of 'dir year*' for NetCDF datasets:

\begin{verbatim}
\end{verbatim}
2.13. Transformation

This section contains modules to perform spectral transformations.

Here is a short overview of all operators in this section:

- **sp2gp**: Spectral to gridpoint
- **gp2sp**: Gridpoint to spectral
- **sp2sp**: Spectral to spectral
- **dv2ps**: D and V to velocity potential and stream function
- **dv2uv**: Divergence and vorticity to U and V wind
- **uv2dv**: U and V wind to divergence and vorticity
- **fourier**: Fourier transformation
2.13.1. SPECTRAL - Spectral transformation

Synopsis

\(<\text{operator}>[\text{gridtype}]\) \text{infile outfile}

Description

This module transforms fields on a global regular Gaussian grid to spectral coefficients and vice versa. The transformation is achieved by applying Fast Fourier Transformation (FFT) first and direct Legendre Transformation afterwards in gp2sp. In sp2gp the inverse Legendre Transformation and inverse FFT are used. Missing values are not supported.

The relationship between the spectral resolution, governed by the truncation number T, and the grid resolution depends on the number of grid points at which the shortest wavelength field is represented. For a grid with 2N points between the poles (so 4N grid points in total around the globe) the relationship is:

- linear grid: the shortest wavelength is represented by 2 grid points \(\rightarrow 4N \approx 2(\text{TL} + 1)\)
- quadratic grid: the shortest wavelength is represented by 3 grid points \(\rightarrow 4N \approx 3(\text{TQ} + 1)\)
- cubic grid: the shortest wavelength is represented by 4 grid points \(\rightarrow 4N \approx 4(\text{TC} + 1)\)

The quadratic grid is used by ECHAM and ERA15. ERA40 is using a linear Gaussian grid reflected by the TL notation.

The following table shows the calculation of the number of latitudes and the triangular truncation for the different grid types:

<table>
<thead>
<tr>
<th>Gridtype</th>
<th>Number of latitudes: nlat</th>
<th>Triangular truncation: ntr</th>
</tr>
</thead>
<tbody>
<tr>
<td>linear</td>
<td>N\text{INT}((ntr*2 + 1)/2)</td>
<td>(nlat*2 - 1) / 2</td>
</tr>
<tr>
<td>quadratic</td>
<td>N\text{INT}((ntr*3 + 1)/2)</td>
<td>(nlat*2 - 1) / 3</td>
</tr>
<tr>
<td>cubic</td>
<td>N\text{INT}((ntr*4 + 1)/2)</td>
<td>(nlat*2 - 1) / 4</td>
</tr>
</tbody>
</table>

Operators

- sp2gp  Spectral to gridpoint
  Convert all spectral fields to a global regular Gaussian grid.

- gp2sp  Gridpoint to spectral
  Convert all Gaussian gridpoint fields to spectral fields.

Parameter

- \text{gridtype} \hspace{1cm} \text{STRING} \hspace{1cm} Type of the grid: quadratic, linear, cubic (default: quadratic)

Example

To transform spectral coefficients from T106 to N80 Gaussian grid use:

\[\text{cdo sp2gp infile outfile}\]

To transform spectral coefficients from TL159 to N80 Gaussian grid use:

\[\text{cdo sp2gp,linear infile outfile}\]
2.13.2. SPECCONV - Spectral conversion

Synopsis

sp2sp,trunc infile outfile

Description

Changed the triangular truncation of all spectral fields. This operator performs downward conversion by cutting the resolution. Upward conversions are achieved by filling in zeros.

Parameter

trunc INTEGER New spectral resolution

2.13.3. WIND2 - D and V to velocity potential and stream function

Synopsis

dv2ps infile outfile

Description

Calculate spherical harmonic coefficients of velocity potential and stream function from spherical harmonic coefficients of relative divergence and vorticity. The divergence and vorticity need to have the names sd and svo or code numbers 155 and 138.
2.13.4. WIND - Wind transformation

Synopsis

<operator>[gridtype] infile outfile

Description

This module converts relative divergence and vorticity to U and V wind and vice versa. Divergence and vorticity are spherical harmonic coefficients in spectral space and U and V are on a global regular Gaussian grid. The Gaussian latitudes need to be ordered from north to south. The maximum number of supported spectral coefficients is 4002000. Missing values are not supported.

The relationship between the spectral resolution, governed by the truncation number \( T \), and the grid resolution depends on the number of grid points at which the shortest wavelength field is represented. For a grid with 2\( N \) points between the poles (so 4\( N \) grid points in total around the globe) the relationship is:

**linear grid:** the shortest wavelength is represented by 2 grid points \( \rightarrow 4N \approx 2(TL + 1) \)

**quadratic grid:** the shortest wavelength is represented by 3 grid points \( \rightarrow 4N \approx 3(TQ + 1) \)

**cubic grid:** the shortest wavelength is represented by 4 grid points \( \rightarrow 4N \approx 4(TC + 1) \)

The quadratic grid is used by ECHAM and ERA15. ERA40 is using a linear Gaussian grid reflected by the TL notation.

The following table shows the calculation of the number of latitudes and the triangular truncation for the different grid types:

<table>
<thead>
<tr>
<th>Gridtype</th>
<th>Number of latitudes: nlat</th>
<th>Triangular truncation: ntr</th>
</tr>
</thead>
<tbody>
<tr>
<td>linear</td>
<td>NINT((ntr*2 + 1)/2)</td>
<td>(nlat*2 - 1) / 2</td>
</tr>
<tr>
<td>quadratic</td>
<td>NINT((ntr*3 + 1)/2)</td>
<td>(nlat*2 - 1) / 3</td>
</tr>
<tr>
<td>cubic</td>
<td>NINT((ntr*4 + 1)/2)</td>
<td>(nlat*2 - 1) / 4</td>
</tr>
</tbody>
</table>

Operators

**dv2uv** Divergence and vorticity to U and V wind
Calculate U and V wind on a Gaussian grid from spherical harmonic coefficients of relative divergence and vorticity. The divergence and vorticity need to have the names sd and svo or code numbers 155 and 138.

**uv2dv** U and V wind to divergence and vorticity
Calculate spherical harmonic coefficients of relative divergence and vorticity from U and V wind. The U and V wind need to be on a Gaussian grid and need to have the names u and v or the code numbers 131 and 132.

Parameter

**gridtype** STRING Type of the grid: quadratic, linear (default: quadratic)

Example

Assume a dataset has at least spherical harmonic coefficients of divergence and vorticity. To transform the spectral divergence and vorticity to U and V wind on a Gaussian grid use:

```
cdo dv2uv infile outfile
```
2.13.5. FOURIER - Fourier transformation

Synopsis

\texttt{fourier,epsilon infile outfile}

Description

The fourier operator performs the fourier transformation or the inverse fourier transformation of all input fields. If the number of timesteps is a power of 2 then the algorithm of the Fast Fourier Transformation (FFT) is used.

It is

\[ o(t,x) = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} i(t,x)e^{i2\pi ij} \]

where a user given \emph{epsilon} = -1 leads to the forward transformation and a user given \emph{epsilon} = 1 leads to the backward transformation.

If the input stream \texttt{infile} consists only of complex fields, then the fields of \texttt{outfile}, computed by

\texttt{cdo -f ext fourier,1 -fourier,-1 infile outfile}

are the same than that of \texttt{infile}. For real input files see function \texttt{retocomplex}.

Parameter

\texttt{epsilon INTEGER} -1: forward transformation; 1: backward transformation

Note

Currently only the EXTRA format supports fields with complex numbers.

This section contains modules to import and export data files which can not read or write directly with CDO.

Here is a short overview of all operators in this section:

- **import_binary**: Import binary data sets
- **import_cmsaf**: Import CM-SAF HDF5 files
- **import_amsr**: Import AMSR binary files
- **input**: ASCII input
- **inputsrv**: SERVICE ASCII input
- **inputext**: EXTRA ASCII input
- **output**: ASCII output
- **outputf**: Formatted output
- **outputint**: Integer output
- **outputsrv**: SERVICE ASCII output
- **outputext**: EXTRA ASCII output
- **outputtab**: Table output
- **gmtxyz**: GMT xyz format
- **gmtcells**: GMT multiple segment format
2.14.1. IMPORTBINARY - Import binary data sets

Synopsis

import_binary infile outfile

Description

This operator imports gridded binary data sets via a GrADS data descriptor file. The GrADS data descriptor file contains a complete description of the binary data as well as instructions on where to find the data and how to read it. The descriptor file is an ASCII file that can be created easily with a text editor. The general contents of a gridded data descriptor file are as follows:

- Filename for the binary data
- Missing or undefined data value
- Mapping between grid coordinates and world coordinates
- Description of variables in the binary data set

A detailed description of the components of a GrADS data descriptor file can be found in [GrADS]. Here is a list of the supported components: BYTESWAPPED, CHSUB, DSET, ENDVARS, FILEHEADER, HEADERBYTES, OPTIONS, TDEF, TITLE, TRAILERBYTES, UNDEF, VARS, XDEF, XYHEADER, YDEF, ZDEF

Note

Only 32-bit IEEE floats are supported for standard binary files!

Example

To convert a binary data file to NetCDF use:

cdo -f nc import_binary infile.ctl outfile.nc

Here is an example of a GrADS data descriptor file:

```
DSET infile.bin
OPTIONS sequential
UNDEF -9e+33
XDEF 360 LINEAR -179.5 1
YDEF 180 LINEAR -89.5 1
ZDEF 1 LINEAR 1 1
TDEF 1 LINEAR 00:00 Z15jun1989 12hr
VARS 1
  param 1 99 description of the variable
ENDVARS
```

The binary data file infile.bin contains one parameter on a global 1 degree lon/lat grid written with FORTRAN record length headers (sequential).
2.14.2. IMPORTCMSAF - Import CM-SAF HDF5 files

Synopsis

import_cmsaf infile outfile

Description

This operator imports gridded CM-SAF (Satellite Application Facility on Climate Monitoring) HDF5 files. CM-SAF exploits data from polar-orbiting and geostationary satellites in order to provide climate monitoring products of the following parameters:

Cloud parameters: cloud fraction (CFC), cloud type (CTY), cloud phase (CPH), cloud top height, pressure and temperature (CTH, CTP, CTT), cloud optical thickness (COT), cloud water path (CWP).

Surface radiation components: Surface albedo (SAL); surface incoming (SIS) and net (SNS) shortwave radiation; surface downward (SDL) and outgoing (SOL) longwave radiation, surface net longwave radiation (SNL) and surface radiation budget (SRB).

Top-of-atmosphere radiation components: Incoming (TIS) and reflected (TRS) solar radiative flux at top-of-atmosphere. Emitted thermal radiative flux at top-of-atmosphere (TET).

Water vapour: Vertically integrated water vapour (HTW), layered vertically integrated water vapour and layer mean temperature and relative humidity for 5 layers (HLW), temperature and mixing ratio at 6 pressure levels.

Daily and monthly mean products can be ordered via the CM-SAF web page (www.cmsaf.eu). Products with higher spatial and temporal resolution, i.e. instantaneous swath-based products, are available on request (contact.cmsaf@dwd.de). All products are distributed free-of-charge. More information on the data is available on the CM-SAF homepage (www.cmsaf.eu).

Daily and monthly mean products are provided in equal-area projections. CDO reads the projection parameters from the metadata in the HDF5-headers in order to allow spatial operations like remapping. For spatial operations with instantaneous products on original satellite projection, additional files with arrays of latitudes and longitudes are needed. These can be obtained from CM-SAF together with the data.

Note

To use this operator, it is necessary to build CDO with HDF5 support (version 1.6 or higher). The PROJ library (version 5.0 or higher) is needed for full support of the remapping functionality.

Example

A typical sequence of commands with this operator could look like this:

```
cdo -f nc remapbil,r360x180 -import_cmsaf cmsaf_product.hdf output.nc
```

(bilinear remapping to a predefined global grid with 1 deg resolution and conversion to NetCDF).

If you work with CM-SAF data on original satellite projection, an additional file with information on geolocation is required, to perform such spatial operations:

```
cdo -f nc remapbil,r720x360 -setgrid,cmsaf_latlon.h5 -import_cmsaf cmsaf.hdf out.nc
```

Some CM-SAF data are stored as scaled integer values. For some operations, it could be desirable (or necessary) to increase the accuracy of the converted products:
2.14.3. IMPORTAMSR - Import AMSR binary files

Synopsis

import_amsr infile outfile

Description

This operator imports gridded binary AMSR (Advanced Microwave Scanning Radiometer) data. The binary data files are available from the AMSR ftp site (ftp://ftp.ssmi.com/amsre). Each file consists of twelve (daily) or five (averaged) 0.25 x 0.25 degree grid (1440,720) byte maps. For daily files, six daytime maps in the following order, Time (UTC), Sea Surface Temperature (SST), 10 meter Surface Wind Speed (WSPD), Atmospheric Water Vapor (VAPOR), Cloud Liquid Water (CLOUD), and Rain Rate (RAIN), are followed by six nighttime maps in the same order. Time-Averaged files contain just the geophysical layers in the same order [SST, WSPD, VAPOR, CLOUD, RAIN]. More information to the data is available on the AMSR homepage http://www.remss.com/amsr.

Example

To convert monthly binary AMSR files to NetCDF use:

```
cdo -f nc amsre_yyyymm5 amsre_yyyymm5.nc
```
2.14.4. INPUT - Formatted input

Synopsis

input grid[,zaxis] outfile
inputsrv outfile
inputext outfile

Description

This module reads time series of one 2D variable from standard input. All input fields need to have the same horizontal grid. The format of the input depends on the chosen operator.

Operators

input ASCII input
Reads fields with ASCII numbers from standard input and stores them in outfile. The numbers read are exactly that ones which are written out by the output operator.

inputsrv SERVICE ASCII input
Reads fields with ASCII numbers from standard input and stores them in outfile. Each field should have a header of 8 integers (SERVICE likely). The numbers that are read are exactly that ones which are written out by the outputsrv operator.

inputext EXTRA ASCII input
Read fields with ASCII numbers from standard input and stores them in outfile. Each field should have header of 4 integers (EXTRA likely). The numbers read are exactly that ones which are written out by the outputext operator.

Parameter

grid STRING Grid description file or name
zaxis STRING Z-axis description file

Example

Assume an ASCII dataset contains a field on a global regular grid with 32 longitudes and 16 latitudes (512 elements). To create a GRIB1 dataset from the ASCII dataset use:

```bash
cdo -f grb input,r32x16 outfile.grb < my_ascii_data
```
2.14.5. OUTPUT - Formatted output

Synopsis

- **output** infiles
- **outputf**, format[, nelem] infiles
- **outputint** infiles
- **outputsrv** infiles
- **outputext** infiles

Description

This module prints all values of all input datasets to standard output. All input fields need to have the same horizontal grid. All input files need to have the same structure with the same variables. The format of the output depends on the chosen operator.

Operators

- **output** ASCII output
  Prints all values to standard output. Each row has 6 elements with the C-style format "%13.6g".
- **outputf** Formatted output
  Prints all values to standard output. The format and number of elements for each row have to be specified by the parameters *format* and *nelem*. The default for *nelem* is 1.
- **outputint** Integer output
  Prints all values rounded to the nearest integer to standard output.
- **outputsrv** SERVICE ASCII output
  Prints all values to standard output. Each field with a header of 8 integers (SERVICE likely).
- **outputext** EXTRA ASCII output
  Prints all values to standard output. Each field with a header of 4 integers (EXTRA likely).

Parameter

- **format** STRING C-style format for one element (e.g. %13.6g)
- **nelem** INTEGER Number of elements for each row (default: nelem = 1)

Example

To print all field elements of a dataset formatted with "%8.4g" and 8 values per line use:

```
cdo outputf,%8.4g,8 infile
```

Example result of a dataset with one field on 64 grid points:

```
<table>
<thead>
<tr>
<th>261.7</th>
<th>262.0</th>
<th>257.8</th>
<th>252.5</th>
<th>248.8</th>
<th>247.7</th>
<th>246.3</th>
<th>246.1</th>
</tr>
</thead>

<td>291.2</td>
</tr>
</tbody>
</table>
```
2.14.6. OUTPUTTAB - Table output

Synopsis

outputtab, params infiles outfile

Description

This operator prints a table of all input datasets to standard output. infiles is an arbitrary number of input files. All input files need to have the same structure with the same variables on different timesteps. All input fields need to have the same horizontal grid.

The contents of the table depends on the chosen parameters. The format of each table parameter is keyname[:len]. len is the optional length of a table entry. Here is a list of all valid keynames:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>

<td>INTEGER</td>
<td>Disable output of header line</td>
</tr>
</tbody>
</table>

Parameter

params STRING Comma-separated list of keynames, one for each column of the table

Example

To print a table with name, date, lon, lat and value information use:

cdo outputtab,name,date,lon,lat,value infile

Here is an example output of a time series with the yearly mean temperature at lon=10/lat=53.5:

<table>
<thead>
<tr>
<th>#</th>
<th>name</th>
<th>date</th>
<th>lon</th>
<th>lat</th>
<th>value</th>

</table>
2.14.7. OUTPUTGMT - GMT output

Synopsis

\(<operator>\) infile

Description

This module prints the first field of the input dataset to standard output. The output can be used to generate 2D Lon/Lat plots with [GMT]. The format of the output depends on the chosen operator.

Operators

- **gmtxyz** GMT xyz format
  - The operator exports the first field to the GMT xyz ASCII format. The output can be used to create contour plots with the GMT module pscontour.

- **gmtcells** GMT multiple segment format
  - The operator exports the first field to the GMT multiple segment ASCII format. The output can be used to create shaded gridfill plots with the GMT module psxy.

Example

1) GMT shaded contour plot of a global temperature field with a resolution of 4 degree. The contour interval is 3 with a rainbow color table.

```bash
cdo gmtxyz temp > data.gmt
makecpt -T213/318/3 -Crainbow > gmt.cpt
pscontour -K -JQ0/10i -Rd -I -Cgmt.cpt data.gmt > gmtplot.ps
pscoast -O -J -R -Dc -W -B40g20 >> gmtplot.ps
```

2) GMT shaded gridfill plot of a global temperature field with a resolution of 4 degree. The contour interval is 3 with a rainbow color table.
cdo gmtcells temp > data.gmt
makecpt -T213/318/3 Crainbow > gmt.cpt
psxy -K -JQ0/10i -Rd -L -Cgmt.cpt -m data.gmt > gmtplot.ps
pscoast -O -J -R -Dc -W -B40g20 >> gmtplot.ps
2.15. Miscellaneous

This section contains miscellaneous modules which do not fit to the other sections before.

2.15.1. GRADSDES - GrADS data descriptor file

Synopsis

gradsdes[,mapversion] infile

Description

Creates a [GrADS] data descriptor file. Supported file formats are GRIB1, NetCDF, SERVICE, EXTRA and IEG. For GRIB1 files the GrADS map file is also generated. For SERVICE and EXTRA files the grid have to be specified with the CDO option `-g <grid>`. This module takes infile in order to create filenames for the descriptor (infile.ctl) and the map (infile.gmp) file.

Parameter

mapversion INTEGER Format version of the GrADS map file for GRIB1 datasets. Use 1 for a machine specific version 1 GrADS map file, 2 for a machine independent version 2 GrADS map file and 4 to support GRIB files >2GB. A version 2 map file can be used only with GrADS version 1.8 or newer. A version 4 map file can be used only with GrADS version 2.0 or newer. The default is 4 for files >2GB, otherwise 2.

Example

To create a GrADS data descriptor file from a GRIB1 dataset use:

cdo gradsdes infile.grb

This will create a descriptor file with the name infile.ctl and the map file infile.gmp.

Assumed the input GRIB1 dataset has 3 variables over 12 timesteps on a Gaussian N16 grid. The contents of the resulting GrADS data description file is approximately:

```
DSET ^ infile.grb
DTYPE GRIB
INDEX ^ infile.gmp
XDEF 64 LINEAR 0.000000 5.625000
YDEF 32 LEVELS = 85.761 = 80.269 = 74.745 = 69.213 = 63.679 = 58.143
                   13.844  19.382  24.920  30.458  35.995  41.532
                   47.070  52.607  58.143  63.679  69.213  74.745
                80.269  85.761
ZDEF 4 LEVELS 925 850 500 200

tslm1 0 139,1,0 surface temperature of land [K]
ENDVARS
```
2.15.2. AFTERBURNER - ECHAM standard post processor

Synopsis

```
after[,vct] infiles outfile
```

Description

The "afterburner" is the standard post processor for [ECHAM] GRIB and NetCDF data which provides the following operations:

- Extract specified variables and levels
- Compute derived variables
- Transform spectral data to Gaussian grid representation
- Vertical interpolation to pressure levels
- Compute temporal means

This operator reads selection parameters as namelist from stdin. Use the UNIX redirection "<namelistfile" to read the namelist from file.

The input files can’t be combined with other CDO operators because of an optimized reader for this operator.

Namelist

Namelist parameter and there defaults:

```
TYPE=0, CODE=-1, LEVEL=-1, INTERVAL=0, MEAN=0, EXTRAPOLATE=1
```

**TYPE** controls the transformation and vertical interpolation. Transforming spectral data to Gaussian grid representation and vertical interpolation to pressure levels are performed in a chain of steps. The **TYPE** parameter may be used to stop the chain at a certain step. Valid values are:

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Hybrid level spectral coefficients</td>
</tr>
<tr>
<td>10</td>
<td>Hybrid level fourier coefficients</td>
</tr>
<tr>
<td>11</td>
<td>Hybrid level zonal mean sections</td>
</tr>
<tr>
<td>20</td>
<td>Hybrid level gauss grids</td>
</tr>
<tr>
<td>30</td>
<td>Pressure level gauss grids</td>
</tr>
<tr>
<td>40</td>
<td>Pressure level fourier coefficients</td>
</tr>
<tr>
<td>41</td>
<td>Pressure level zonal mean sections</td>
</tr>
<tr>
<td>50</td>
<td>Pressure level spectral coefficients</td>
</tr>
<tr>
<td>60</td>
<td>Pressure level fourier coefficients</td>
</tr>
<tr>
<td>61</td>
<td>Pressure level zonal mean sections</td>
</tr>
<tr>
<td>70</td>
<td>Pressure level gauss grids</td>
</tr>
</tbody>
</table>

Vorticity, divergence, streamfunction and velocity potential need special treatment in the vertical transformation. They are not available as types 30, 40 and 41. If you select one of these combinations, type is automatically switched to the equivalent types 70, 60 and 61. The type of all other variables will be switched too, because the type is a global parameter.

**CODE** selects the variables by the ECHAM GRIB1 code number (1-255). The default value *-1* processes all detected codes. Derived variables computed by the afterburner:
LEVEL selects the hybrid or pressure levels. The allowed values depends on the parameter TYPE. The default value -1 processes all detected levels.

INTERVAL selects the processing interval. The default value 0 process data on monthly intervals. INTERVAL=1 sets the interval to daily.

MEAN=1 compute and write monthly or daily mean fields. The default value 0 writes out all timesteps.

EXTRAPOLATE=0 switch of the extrapolation of missing values during the interpolation from model to pressure level (only available with MEAN=0 and TYPE=30). The default value 1 extrapolate missing values.

Possible combinations of TYPE, CODE and MEAN:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>CODE</th>
<th>MEAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/10/11</td>
<td>130 temperature</td>

<td>0</td>
</tr>
<tr>
<td>0/10/11</td>
<td>148 streamfunction</td>
<td>0</td>
</tr>
<tr>
<td>0/10/11</td>
<td>149 velocity potential</td>
<td>0</td>
</tr>
<tr>
<td>0/10/11</td>
<td>152 LnPs</td>
<td>0</td>
</tr>
<tr>
<td>0/10/11</td>
<td>155 divergence</td>
<td>0</td>
</tr>
<tr>
<td>&gt;11</td>
<td>all codes</td>
<td>0/1</td>
</tr>
</tbody>
</table>

Parameter

vct STRING File with VCT in ASCII format

Example

To interpolate ECHAM hybrid model level data to pressure levels of 925, 850, 500 and 200 hPa, use:

```
cdo after infile outfile << EON
   TYPE=30 LEVEL=92500,85000,50000,20000
EON
```
2.15.3. FILTER - Time series filtering

Synopsis

```
bandpass, fmin, fmax  infile  outfile
lowpass,  fmax       infile  outfile
highpass, fmin       infile  outfile
```

Description

This module takes the time series for each gridpoint in `infile` and (fast fourier) transforms it into the frequency domain. According to the particular operator and its parameters certain frequencies are filtered (set to zero) in the frequency domain and the spectrum is (inverse fast fourier) transformed back into the time domain. To determine the frequency the time-axis of `infile` is used. (Data should have a constant time increment since this assumption applies for transformation. However, the time increment has to be different from zero.) All frequencies given as parameter are interpreted per year. This is done by the assumption of a 365-day calendar. Consequently if you want to perform multiyear-filtering accurately you have to delete the 29th of February. If your `infile` has a 360 year calendar the frequency parameters `fmin` respectively `fmax` should be multiplied with a factor of 360/365 in order to obtain accurate results. For the set up of a frequency filter the frequency parameters have to be adjusted to a frequency in the data. Here `fmin` is rounded down and `fmax` is always rounded up. Consequently it is possible to use bandpass with `fmin=fmax` without getting a zero-field for `outfile`.

Hints for efficient usage:

- to get reliable results the time-series has to be detrended (cdo detrend)
- the lowest frequency greater zero that can be contained in `infile` is $1/(N*dT)$,
- the greatest frequency is $1/(2dT)$ (Nyquist frequency),

with $N$ the number of timesteps and $dT$ the time increment of `infile` in years.

Missing value support for operators in this module is not implemented, yet!

Operators

```
bandpass    Bandpass filtering
            Bandpass filtering (pass for frequencies between `fmin` and `fmax`). Suppresses all variability outside the frequency range specified by `[fmin,fmax]`.

lowpass     Lowpass filtering
            Lowpass filtering (pass for frequencies lower than `fmax`). Suppresses all variability with frequencies greater than `fmax`.

highpass    Highpass filtering
            Highpass filtering (pass for frequencies greater than `fmin`). Suppresses all variability with frequencies lower than `fmin`.
```

Parameter

```
  fmin    FLOAT    Minimum frequency per year that passes the filter.
  fmax    FLOAT    Maximum frequency per year that passes the filter.
```

Note

For better performance of these operators use the CDO configure option –with-fftw3.
Example
Now assume your data are still hourly for a time period of 5 years but with a 365/366-day- calendar and you want to suppress the variability on timescales greater or equal to one year (we suggest here to use a number \( x \) bigger than one (e.g. \( x=1.5 \)) since there will be dominant frequencies around the peak (if there is one) as well due to the issue that the time series is not of infinite length). Therefore you can use the following:

```
cdo highpass,x -del29feb infile outfile
```

Accordingly you might use the following to suppress variability on timescales shorter than one year:

```
cdo lowpass,1 -del29feb infile outfile
```

Finally you might be interested in 2-year variability. If you want to suppress the seasonal cycle as well as say the longer cycles in climate system you might use

```
cdo bandpass,x,y -del29feb infile outfile
```

with \( x \leq 0.5 \) and \( y \geq 0.5 \).

2.15.4. GRIDCELL - Grid cell quantities

Synopsis

```
<operator> infile outfile
```

Description
This module reads the grid cell area of the first grid from the input stream. If the grid cell area is missing it will be computed from the grid coordinates. The area of a grid cell is calculated using spherical triangles from the coordinates of the center and the vertices. The base is a unit sphere which is scaled with the radius of the earth. The default earth radius is 6371000 meter. This value can be changed with the environment variable PLANET_RADIUS. Depending on the chosen operator the grid cell area or weights are written to the output stream.

Operators

- **gridarea**
  - Grid cell area
  - Writes the grid cell area to the output stream. If the grid cell area have to be computed it is scaled with the earth radius to square meters.

- **gridweights**
  - Grid cell weights
  - Writes the grid cell area weights to the output stream.

Environment

- **PLANET_RADIUS**
  - This variable is used to scale the computed grid cell areas to square meters. By default PLANET_RADIUS is set to an earth radius of 6371000 meter.
2.15.5. SMOOTH - Smooth grid points

Synopsis

smooth[,options] infile outfile
smooth9 infile outfile

Description

Smooth all grid points of a horizontal grid. Options is a comma-separated list of 'key=value' pairs with optional parameters.

Operators

smooth Smooth grid points
Performs a N point smoothing on all input fields. The number of points used depend on the search radius (radius) and the maximum number of points (maxpoints). Per default all points within the search radius of 1degree are used. The weights for the points depend on the form of the curve and the distance. The implemented form of the curve is linear with constant default weights of 0.25 at distance 0 (weight0) and at the search radius (weightR).

smooth9 9 point smoothing
Performs a 9 point smoothing on all fields with a quadrilateral curvilinear grid. The result at each grid point is a weighted average of the grid point plus the 8 surrounding points. The center point receives a weight of 1.0, the points at each side and above and below receive a weight of 0.5, and corner points receive a weight of 0.3. All 9 points are multiplied by their weights and summed, then divided by the total weight to obtain the smoothed value. Any missing data points are not included in the sum; points beyond the grid boundary are considered to be missing. Thus the final result may be the result of an averaging with less than 9 points.

Parameter

nsmooth INTEGER Number of times to smooth, default nsmooth=1
radius STRING Search radius, default radius=1deg (units: deg, rad, km, m)
maxpoints INTEGER Maximum number of points, default maxpoints=<gridsize>
form STRING Form of the curve, default form=linear
weight0 FLOAT Weight at distance 0, default weight0=0.25
weightR FLOAT Weight at the search radius, default weightR=0.25

2.15.6. DELTAT - Difference between timesteps

Synopsis

deltat infile outfile

Description

This operator computes the difference between each timestep.
2.15.7. REPLACEVALUES - Replace variable values

Synopsis

setvals, oldval,newval[,...] infile outfile
setrtoc, rmin,rmax,c infile outfile
setrtoc2, rmin,rmax,c,c2 infile outfile

Description

This module replaces old variable values with new values, depending on the operator.

Operators

setvals  Set list of old values to new values
          Supply a list of n pairs of old and new values.
setrtoc  Set range to constant
          o(t,x) = \begin{cases} 
          c & \text{if } i(t,x) \geq rmin \land i(t,x) \leq rmax \\
          i(t,x) & \text{if } i(t,x) < rmin \lor i(t,x) > rmax 
\end{cases}
setrtoc2 Set range to constant others to constant2
          o(t,x) = \begin{cases} 
          c & \text{if } i(t,x) \geq rmin \land i(t,x) \leq rmax \\
          c2 & \text{if } i(t,x) < rmin \lor i(t,x) > rmax 
\end{cases}

Parameter

oldval,newval,...           FLOAT   Pairs of old and new values
rmin                          FLOAT   Lower bound
rmax                          FLOAT   Upper bound
c                              FLOAT   New value - inside range
c2                             FLOAT   New value - outside range
2.15.8. VARGEN - Generate a field

Synopsis

const, const, grid outfile
random, grid[, seed] outfile
topo[, grid] outfile
seq, start, end[, inc] outfile
stdatm, levels outfile

Description

Generates a dataset with one or more fields

Operators

const Create a constant field
Create a constant field. All field elements of the grid have the same value.
random Create a field with random numbers
Create a field with rectangularly distributed random numbers in the interval [0,1].
topo Create a field with topography
Create a field with topography data, per default on a global half degree grid.
seq Create a time series
Create a time series with field size 1 and field elements beginning with a start value in time step 1 which is increased from one time step to the next.
stdatm Create values for pressure and temperature for hydrostatic atmosphere
Create pressure and temperature values for the given list of vertical levels. The formulas are:

\[ P(z) = P_0 \exp \left( -\frac{g \cdot H}{R \cdot T_0} \log \left( \frac{\exp \left( \frac{z}{H} \cdot T_0 + \Delta T \right)}{T_0 + \Delta T} \right) \right) \]

\[ T(z) = T_0 + \Delta T \exp \left( -\frac{z}{H} \right) \]

with the following constants

\[ T_0 = 213 \text{K} \quad : \text{offset to get a surface temperature of 288K} \]
\[ \Delta T = 75 \text{K} \quad : \text{Temperature lapse rate for 10Km} \]
\[ P_0 = 1013.25 \text{hPa} \quad : \text{surface pressure} \]
\[ H = 10000.0 \text{m} \quad : \text{scale height} \]
\[ g = 9.80665 \frac{\text{m}}{\text{s}^2} \quad : \text{earth gravity} \]
\[ R = 287.05 \frac{\text{J}}{\text{kg} \cdot \text{K}} \quad : \text{gas constant for air} \]

This is the solution for the hydrostatic equations and is only valid for the troposphere (constant positive lapse rate). The temperature increase in the stratosphere and other effects of the upper atmosphere are not taken into account.
Parameter

- **const**: FLOAT, Constant
- **seed**: INTEGER, The seed for a new sequence of pseudo-random numbers [default: 1]
- **grid**: STRING, Target grid description file or name
- **start**: FLOAT, Start value of the loop
- **end**: FLOAT, End value of the loop
- **inc**: FLOAT, Increment of the loop [default: 1]
- **levels**: FLOAT, Target levels in metre above surface

Example

To create a standard atmosphere dataset on a given horizontal grid:

```bash
cdo enlarge,gridfile -stdatm,10000,8000,5000,3000,2000,1000,500,200,0 outfile
```

2.15.9. TIMSORT - Timsort

Synopsis

```bash
timsort infile outfile
```

Description

Sorts the elements in ascending order over all timesteps for every field position. After sorting it is:

\[
o(t_1, x) \leq o(t_2, x) \quad \forall (t_1 < t_2), x
\]

Example

To sort all field elements of a dataset over all timesteps use:

```bash
cdo timsort infile outfile
```
2.15.10. WINDTRANS - Wind Transformation

Synopsis

\[ \text{uvDestag}, u,v[,-/+0.5][-/+0.5] \] \text{ infile outfile}  
\[ \text{rotuvNorth}, u,v \] \text{ infile outfile}  
\[ \text{projuvLatLon}, u,v \] \text{ infile outfile}  

Description

This module contains special operators for datasets with wind components on a rotated lon/lat grid, e.g. data from the regional model HIRLAM or REMO.

Operators

\textbf{uvDestag}  
Destaggering of u/v wind components  
This is a special operator for destaggering of wind components. If the file contains a grid with temperature (name=’t’ or code=11) then grid_temp will be used for destaggered wind.

\textbf{rotuvNorth}  
Rotate u/v wind to North pole.  
This is an operator for transformation of wind-vectors from grid-relative to north-pole relative for the whole file. (FAST implementation with JACOBIANS)

\textbf{projuvLatLon}  
Cylindrical Equidistant projection  
Thus is an operator for transformation of wind-vectors from the globe-spherical coordinate system into a flat Cylindrical Equidistant (lat-lon) projection. (FAST JACOBIAN implementation)

Parameter

\textbf{u,v}  
STRING  
Pair of u,v wind components (use variable names or code numbers)

\textbf{-/+0.5,-/+0.5}  
STRING  
Destaggered grid offsets are optional (default -0.5,-0.5)

Example

Typical operator sequence on HIRLAM NWP model output (LAMH_D11 files):

\begin{verbatim}
  cdo uvDestag,33,34 inputfile inputfile_destag  
  cdo rotuvNorth,33,34 inputfile_destag inputfile_rotuvN
\end{verbatim}
2.15.11. ROTUVB - Rotation

Synopsis

rotuvb,u,v,... infile outfile

Description

This is a special operator for datasets with wind components on a rotated grid, e.g. data from the regional model REMO. It performs a backward transformation of velocity components U and V from a rotated spherical system to a geographical system.

Parameter

u,v,... STRING Pairs of zonal and meridional velocity components (use variable names or code numbers)

Example

To transform the u and v velocity of a dataset from a rotated spherical system to a geographical system use:

```
cdo rotuvb,u,v infile outfile
```

2.15.12. MASTRFU - Mass stream function

Synopsis

mastrfu infile outfile

Description

This is a special operator for the post processing of the atmospheric general circulation model [ECHAM]. It computes the mass stream function (code=272). The input dataset have to be a zonal mean of v-velocity [m/s] (code=132) on pressure levels.

Example

To compute the mass stream function from a zonal mean v-velocity dataset use:

```
cdo mastrfu infile outfile
```
2.15.13. DERIVEPAR - Derived model parameters

Synopsis

\(<\text{operator}>\) infile outfile

Description

This module contains operators that calculate derived model parameters. These are currently the parameters sea level pressure and geopotential height. All necessary input parameters are identified by their GRIB1 code number or the NetCDF CF standard name. Supported GRIB1 parameter tables are: WMO standard table number 2 and ECMWF local table number 128.

Operators

sealevelpressure  Sea level pressure
This operator computes the sea level pressure (air_pressure_at_sea_level).
Required input fields are surface_air_pressure, surface_geopotential and air_temperature on hybrid sigma pressure levels.

gheight  Geopotential height
This operator computes the geopotential height (geopotential_height) on model levels in metres. Required input fields are surface_air_pressure, surface_geopotential, specific_humidity and air_temperature on hybrid sigma pressure levels. Note, this procedure is an approximation, which doesn’t take into account the effects of e.g. cloud ice and water, rain and snow.
2.15.14. ADISIT - Potential temperature to in-situ temperature and vice versa

Synopsis

\[ \text{adisit[, pressure]} \] infile outfile
\[ \text{adipot} \] infile outfile

Description

Operators

\text{adisit} \quad \text{Potential temperature to in-situ temperature}
This is a special operator for the post processing of the ocean and sea ice model output. It converts potential temperature adiabatically to in-situ temperature to\((t, s, p)\). Required input fields are sea water potential temperature (name=\(\text{tho}\); code=2) and sea water salinity (name=\(\text{sao}\); code=5). Pressure is calculated from the level information or can be specified by the optional parameter. Output fields are sea water temperature (name=\(\text{to}\); code=20) and sea water salinity (name=\(\text{s}\); code=5).

\text{adipot} \quad \text{In-situ temperature to potential temperature}
This is a special operator for the post processing of the ocean and sea ice model output. It converts in-situ temperature to potential temperature \(\text{tho}(t, s, p)\). Required input fields are sea water in-situ temperature (name=\(t\); code=2) and sea water salinity (name=\(\text{sao},s\); code=5). Pressure is calculated from the level information or can be specified by the optional parameter. Output fields are sea water temperature (name=\(\text{tho}\); code=2) and sea water salinity (name=\(s\); code=5).

Parameter

\text{pressure} \quad \text{FLOAT} \quad \text{Pressure in bar (constant value assigned to all levels)}

2.15.15. RHOPOT - Calculates potential density

Synopsis

\[ \text{rhopot[, pressure]} \] infile outfile

Description

This is a special operator for the post processing of the ocean and sea ice model [MPIOM]. It calculates the sea water potential density (name=\(\text{rhopoto}\); code=18). Required input fields are sea water in-situ temperature (name=\(\text{to}\); code=20) and sea water salinity (name=\(\text{sao},s\); code=5). Pressure is calculated from the level information or can be specified by the optional parameter.

Parameter

\text{pressure} \quad \text{FLOAT} \quad \text{Pressure in bar (constant value assigned to all levels)}

Example

To compute the sea water potential density from the potential temperature use this operator in combination with \text{adisit}:

\[ \text{cdo rhopot -adisit infile outfile} \]
2.15.16. HISTOGRAM - Histogram

Synopsis

\(<\text{operator}>,\text{bounds} \ \text{infile} \ \text{outfile}\)

Description

This module creates bins for a histogram of the input data. The bins have to be adjacent and have non-overlapping intervals. The user has to define the bounds of the bins. The first value is the lower bound and the second value the upper bound of the first bin. The bounds of the second bin are defined by the second and third value, aso. Only 2-dimensional input fields are allowed. The output file contains one vertical level for each of the bins requested.

Operators

</table>

2.15.17. SETHALO - Set the left and right bounds of a field

Synopsis

\(\text{sethalo, lhalo, rhalo} \ \text{infile} \ \text{outfile}\)

Description

This operator sets the left and right bounds of the rectangularly understood fields. Positive numbers of the parameter \textit{lhalo} enlarges the left bound by the given number of columns from the right bound. The parameter \textit{rhalo} does the similar for the right bound. Negative numbers of the parameter \textit{lhalo/rhalo} can be used to remove the given number of columns of the left and right bounds.

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lhalo</td>
<td>INTEGER</td>
<td>Left halo</td>
</tr>
<tr>
<td>rhalo</td>
<td>INTEGER</td>
<td>Right halo</td>
</tr>
</tbody>
</table>
2.15.18. WCT - Windchill temperature

Synopsis

\texttt{wct infile1 infile2 outfile}

Description

Let \texttt{infile1} and \texttt{ infile2} be time series of temperature and wind speed records, then a corresponding time series of resulting windchill temperatures is written to \texttt{outfile}. The wind chill temperature calculation is only valid for a temperature of $T \leq 33$ °C and a wind speed of $v \geq 1.39$ m/s. Whenever these conditions are not satisfied, a missing value is written to \texttt{outfile}. Note that temperature and wind speed records have to be given in units of °C and m/s, respectively.

2.15.19. FDNS - Frost days where no snow index per time period

Synopsis

\texttt{fdns infile1 infile2 outfile}

Description

Let \texttt{infile1} be a time series of the daily minimum temperature $T_N$ and \texttt{infile2} be a corresponding series of daily surface snow amounts. Then the number of days where $T_N < 0$ °C and the surface snow amount is less than 1 cm is counted. The temperature $T_N$ have to be given in units of Kelvin. The date information of a timestep in \texttt{ outfile} is the date of the last contributing timestep in \texttt{ infile}.

2.15.20. STRWIN - Strong wind days index per time period

Synopsis

\texttt{strwin[,v]} infile outfile

Description

Let \texttt{ infile} be a time series of the daily maximum horizontal wind speed $V_X$, then the number of days where $V_X > v$ is counted. The horizontal wind speed $v$ is an optional parameter with default $v = 10.5$ m/s. A further output variable is the maximum number of consecutive days with maximum wind speed greater than or equal to $v$. Note that both $V_X$ and $v$ have to be given in units of m/s. Also note that the horizontal wind speed is defined as the square root of the sum of squares of the zonal and meridional wind speeds. The date information of a timestep in \texttt{ outfile} is the date of the last contributing timestep in \texttt{ infile}.

Parameter

- $v$ FLOAT Horizontal wind speed threshold (m/s, default $v = 10.5$ m/s)
2.15.21. STRBRE - Strong breeze days index per time period

Synopsis

```
strbre infile outfile
```

Description

Let `infile` be a time series of the daily maximum horizontal wind speed `VX`, then the number of
days where `VX` is greater than or equal to 10.5 m/s is counted. A further output variable is the
maximum number of consecutive days with maximum wind speed greater than or equal to 10.5 m/s.
Note that `VX` is defined as the square root of the sum of squares of the zonal and meridional wind
speeds and have to be given in units of m/s. The date information of a timestep in `outfile` is the
date of the last contributing timestep in `infile`.

2.15.22. STRGAL - Strong gale days index per time period

Synopsis

```
strgal infile outfile
```

Description

Let `infile` be a time series of the daily maximum horizontal wind speed `VX`, then the number of
days where `VX` is greater than or equal to 20.5 m/s is counted. A further output variable is the
maximum number of consecutive days with maximum wind speed greater than or equal to 20.5 m/s.
Note that `VX` is defined as the square root of the sum of squares of the zonal and meridional wind
speeds and have to be given in units of m/s. The date information of a timestep in `outfile` is the
date of the last contributing timestep in `infile`.

2.15.23. HURR - Hurricane days index per time period

Synopsis

```
hurr infile outfile
```

Description

Let `infile` be a time series of the daily maximum horizontal wind speed `VX`, then the number of
days where `VX` is greater than or equal to 32.5 m/s is counted. A further output variable is the
maximum number of consecutive days with maximum wind speed greater than or equal to 32.5 m/s.
Note that `VX` is defined as the square root of the sum of squares of the zonal and meridional wind
speeds and have to be given in units of m/s. The date information of a timestep in `outfile` is the
date of the last contributing timestep in `infile`.

2.15.24. CMORLITE - CMOR lite

Synopsis

```cmorlite,table[,convert] infile outfile```

Description

The [CMOR] (Climate Model Output Rewriter) library comprises a set of functions, that can be used to produce CF-compliant NetCDF files that fulfill the requirements of many of the climate community’s standard model experiments. These experiments are collectively referred to as MIP’s. Much of the metadata written to the output files is defined in MIP-specific tables, typically made available from each MIP’s web site.

The CDO operator cmorlite process the header and variable section of such MIP tables and writes the result with the internal IO library [CDI]. In addition to the CMOR 2 and 3 table format, the CDO parameter table format is also supported. The following parameter table entries are available:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>WORD</td>
<td>Name of the variable</td>
</tr>
<tr>
<td>out_name</td>
<td>WORD</td>
<td>New name of the variable</td>
</tr>
<tr>
<td>type</td>
<td>WORD</td>
<td>Data type (real or double)</td>
</tr>
<tr>
<td>standard_name</td>
<td>WORD</td>
<td>As defined in the CF standard name table</td>
</tr>
<tr>
<td>long_name</td>
<td>STRING</td>
<td>Describing the variable</td>
</tr>
<tr>
<td>units</td>
<td>STRING</td>
<td>Specifying the units for the variable</td>
</tr>
<tr>
<td>comment</td>
<td>STRING</td>
<td>Information concerning the variable</td>
</tr>
<tr>
<td>cell_methods</td>
<td>STRING</td>
<td>Information concerning calculation of means or climatologies</td>
</tr>
<tr>
<td>cell_measures</td>
<td>STRING</td>
<td>Indicates the names of the variables containing cell areas and volumes</td>
</tr>
<tr>
<td>missing_value</td>
<td>FLOAT</td>
<td>Specifying how missing data will be identified</td>
</tr>
<tr>
<td>valid_min</td>
<td>FLOAT</td>
<td>Minimum valid value</td>
</tr>
<tr>
<td>valid_max</td>
<td>FLOAT</td>
<td>Maximum valid value</td>
</tr>
<tr>
<td>ok_min_mean_abs</td>
<td>FLOAT</td>
<td>Minimum absolute mean</td>
</tr>
<tr>
<td>ok_max_mean_abs</td>
<td>FLOAT</td>
<td>Maximum absolute mean</td>
</tr>
<tr>
<td>factor</td>
<td>FLOAT</td>
<td>Scale factor</td>
</tr>
<tr>
<td>delete</td>
<td>INTEGER</td>
<td>Set to 1 to delete variable</td>
</tr>
<tr>
<td>convert</td>
<td>INTEGER</td>
<td>Set to 1 to convert the unit if necessary</td>
</tr>
</tbody>
</table>

Most of the above entries are stored as variables attributes, some of them are handled differently. The variable `name` is used as a search key for the parameter table. `valid_min, valid_max, ok_min_mean_abs` and `ok_max_mean_abs` are used to check the range of the data.

Parameter

```table STRING Name of the CMOR table as specified from PCMDI```

```convert STRING Converts the units if necessary```

Example

Here is an example of a parameter table for one variable:

```
prompt> cat mypartab
&parameter
  name = t
```
out_name    = ta
standard_name = air_temperature
units        = "K"
missing_value = 1.0e+20
valid_min    = 157.1
valid_max    = 336.3
/

To apply this parameter table to a dataset use:

cdo -f nc cmorlite,mypartab,convert infile outfile

This command renames the variable t to ta. The standard name of this variable is set to air_temperature and the unit is set to [K] (converts the unit if necessary). The missing value will be set to 1.0e+20. In addition it will be checked whether the values of the variable are in the range of 157.1 to 336.3. The result will be stored in NetCDF.

2.15.25. VERIFYGRID - Verify grid coordinates

Synopsis

verifygrid  infile

Description

This operator verifies the coordinates of all horizontal grids found in infile. Among other things, it searches for duplicate cells, non-convex cells, and whether the center is located outside the cell bounds. Use the CDO option -v to output the position of these cells. This information can be useful to avoid problems when interpolating the data.
3. Contributors

3.1. History

CDO was originally developed by Uwe Schulzeida at the Max Planck Institute for Meteorology (MPI-M). The first public release is available since 2003. The MPI-M, together with the DKRZ, has a long history in the development of tools for processing climate data. CDO was inspired by some of these tools, such as the PINGO package and the GRIB-Modules.

PINGO\(^1\) was developed by Jürgen Waszkewitz, Peter Lenzen, and Nathan Gillet in 1995 at the DKRZ, Hamburg (Germany). CDO has a similar user interface and uses some of the PINGO routines.

The GRIB-Modules was developed by Heiko Borgert and Wolfgang Welke in 1991 at the MPI-M. CDO is using a similar module structure and also some of the routines.

3.2. External sources

CDO has incorporated code from several sources:

**afterburner** is a postprocessing application for ECHAM data and ECMWF analysis data, originally developed by Edilbert Kirk, Michael Ponater and Arno Hellbach. The afterburner code was modified for the CDO operators after, ml2pl, ml2hl, sp2gp, gp2sp.

**SCRIP** is a software package used to generate interpolation weights for remapping fields from one grid to another in spherical geometry [SCRIP]. It was developed at the Los Alamos National Laboratory by Philip W. Jones. The SCRIP library was converted from Fortran to ANSI C and is used as the base for the remapping operators in CDO.

**YAC** (Yet Another Coupler) was jointly developed by DKRZ and MPI-M by Moritz Hanke and Rene Redler [YAC]. CDO is using the clipping and cell search routines for the conservative remapping with remapcon.

**libkdtree** a C99 implementation of the kd-tree algorithm developed by Jörg Dietrich.

CDO uses tools from the GNU project, including automake, and libtool.

3.3. Contributors

The primary contributors to the CDO development have been:

**Uwe Schulweida** : Concept, design and implementation of CDO, project coordination, and releases.

**Luis Kornblueh** : He supports CDO from the beginning. His main contributions are GRIB performance and compression, GME and unstructured grid support. Luis also helps with design and planning.

**Ralf Müller** : He is working on CDO since 2009. His main contributions are the implementation of the User Portal, the ruby and python interface for all CDO operators, the building process and the Windows support. The CDO User Portal was funded by the European Commission infrastructure project IS-ENES. Ralf also helps a lot with the user support. Implemented operators: intlevel3d, consecsum, consects, ngrids, ngridpoints, reducegrid

---

\(^1\)Procedural INterface for GRIB formatted Objects
Contributors

Cedrick Ansorge: He worked on the software package CDO as a student assistant at MPI-M from 2007-2011. Implemented operators: eof, eof3d, enscrps, ensbrs, maskregion, bandpass, lowpass, highpass, smooth9

Oliver Heidmann: He worked on the software package CDO as a student assistant at MPI-M from 2015-2018.

Karin Meier-Fleischer: She is working in the CDO user support since 2017.

Fabian Wachsmann: He is working on CDO for the CMIP6 project since 2016. His main task is the implementation and support of the cmor operator. He has also implemented the ETCCDI Indices of Daily Temperature and Precipitation Extremes.

Ralf Quast: He worked on CDO on behalf of the Service Gruppe Anpassung (SGA), DKRZ in 2006. He implemented all ECA Indices of Daily Temperature and Precipitation Extremes, all percentile operators, module YDRUNSTAT and wct.

Kameswarrao Modali: He worked on CDO from 2012-2013.
Implemented operators: contour, shaded, grfill, vector, graph.

Michal Koutek: Implemented operators: selmulti delmulti, changemulti, samplegrid, uvDestag, rotu-vNorth, projuvLatLon.

Etienne Tourigny: Implemented operators: setclonlatbox, setcindexbox, setvals, splitsel, histfreq, setrtoc, setrtoc2.

Asela Rajapakse: He worked on CDO from 2016-2017 as part of the EUDAT project.
Implemented operator: verifygrid

Many users have contributed to CDO by sending bug reports, patches and suggestions over time. Very helpful is also the active participation in the user forum of some users. Here is an incomplete list:

# A. Environment Variables

The following table describes the environment variables that affect CDO.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDO_DOWNLOAD_PATH</td>
<td>./</td>
<td>Path where CDO stores downloads.</td>
</tr>
<tr>
<td>CDO_FILE_SUFFIX</td>
<td>None</td>
<td>Default file suffix. This suffix will be added to the output file name instead of the filename extension derived from the file format. NULL will disable the adding of a file suffix.</td>
</tr>
<tr>
<td>CDO_GRIDSEARCH_RADIUS</td>
<td>180</td>
<td>Grid search radius in degree. Used by the operators setmisstonn, remapdis and remapnn.</td>
</tr>
<tr>
<td>CDO_HISTORY_INFO</td>
<td>1</td>
<td>Append NetCDF global attribute history</td>
</tr>
<tr>
<td>CDO_ICON_GRIDS</td>
<td></td>
<td>Root directory of the ICON grids (e.g. /pool/data/ICON).</td>
</tr>
<tr>
<td>CDO_PCTL_NBINS</td>
<td>101</td>
<td>Number of histogram bins.</td>
</tr>
<tr>
<td>CDO_RESET_HISTORY</td>
<td>0</td>
<td>Set to 1 to reset the NetCDF history global attribute.</td>
</tr>
<tr>
<td>CDO_REMAP_NORM</td>

<td>Choose the normalization for the conservative interpolation</td>
</tr>
<tr>
<td>CDO_TIMESTAT_DATE</td>
<td>None</td>
<td>Set target timestamp of a temporal statistic operator to the 'first', 'middle', 'midhigh' or 'last' contributing source timestep.</td>
</tr>
<tr>
<td>CDO_USE_FFTW</td>
<td>1</td>
<td>Set to 0 to switch off usage of FFTW. Used in the Filter module.</td>
</tr>
<tr>
<td>CDO_VERSION_INFO</td>
<td>1</td>
<td>Set to 0 to disable NetCDF global attribute CDO</td>
</tr>
</tbody>
</table>
B. Parallelized operators

Some of the CDO operators are parallelized with OpenMP. To use CDO with multiple OpenMP threads, you have to set the number of threads with the option '-P'. Here is an example to distribute the bilinear interpolation on 8 OpenMP threads:

```
cdo -P 8 remapbil,targetgrid infile outfile
```

The following CDO operators are parallelized with OpenMP:

<table>
<thead>

</table>
D. Grid description examples

D.1. Example of a curvilinear grid description

Here is an example for the CDO description of a curvilinear grid. xvals/yvals describe the positions of the 6x5 quadrilateral grid cells. The first 4 values of xbounds/ybounds are the corners of the first grid cell.

```
gridtype = curvilinear
gridsize = 30
xsize = 6
ysize = 5
xvals =
   -21  -11  0  11  21  30  -25  -13  0  13
   25  -31  -16  0  16  31  43  -38  -21
   0  21  38  52  -51  -30  0  30  51  64
xbounds =
   -23  -14  -17  -28  -14  -5  -6  -17  -5  5  6  -6
   -5  14  17  6  14  23  28  17  23  32  38  28
   -28  -17  -21  -34  -17  -6  -7  -21  -6  6  7  -7
   6  17  21  7  17  28  34  21  28  38  44  34
   -34  -21  -27  -41  -21  -7  -9  -27  -7  7  9  -9
   7  21  27  9  21  34  41  27  34  44  52  41
   -9  27  35  13  27  41  51  35  41  52  63  51
   13  35  51  21  35  51  67  51  51  63  77  67
yvals =
   29  32  32  32  29  26  39  42  42  42
   39  35  48  51  52  51  48  43  57  61
   62  61  57  51  65  70  72  70  65  58
ybounds =
   23  26  36  32  26  27  37  36  27  27  37  37

Figure D.1.: Orthographic and Robinson projection of the curvilinear grid, the first grid cell is colored red
D.2. Example description for an unstructured grid

Here is an example of the CDO description for an unstructured grid. xvals/yvals describe the positions of 30 independent hexagonal grid cells. The first 6 values of xbounds/ybounds are the corners of the first grid cell. The grid cell corners have to rotate counterclockwise. The first grid cell is colored red.

gridtype = unstructured
gridsize = 30
nvertex = 6
xvals = −36 36 0 −18 18 108 72 54 90 180 144 126 162 −108 −144
